THE RELIGION OF ANCIENT EGYPT

BY

A. H. SAYCE, D.D., LL.D.
PROFESSOR OF ASSYRIOLOGY, OXFORD

SECOND EDITION
PREFACE TO THE SECOND EDITION.

A WORD or two of explanation is perhaps needed as regards the form of this second edition of my Gifford Lectures. The second part of the volume containing the Lectures on the religion of ancient Babylonia has been omitted. This has been necessitated by the large amount of new material and knowledge which has been accumulated on the subject since the publication of the first edition of my book. The activity of the various excavating expeditions which have been ransacking the old libraries of Babylonia, the publication and interpretation of numberless cuneiform tablets in the Museums of Europe and America, and the accession of fresh workers in the field of Babylonian religion have not only compelled a revision of many of our ideas upon the subject, but have so enlarged our knowledge as to make it impossible any longer to include anything like an adequate account of Babylonian religion within the limits of the present volume. It now demands a volume to itself, which I hope will not be long in appearing.

A. H. SAYCE.

August 1913.
PREFACE TO THE FIRST EDITION.

The subject of the following Lectures was "The Conception of the Divine among the ancient Egyptians and Babylonians," and in writing them it was this aspect of them which I kept constantly in view. The time, however, has not yet come for a systematic history of Babylonian religion, but the case is different as regards the religion of ancient Egypt. Thanks more especially to Sir Gaston Maspero's unrivalled combination of learning and genius, we are beginning to learn what the old Egyptian faith actually was, and what were the foundations on which it rested. The development of its dogmas can be traced, at all events to a certain extent, and we can even watch the progress of their decay.

There are two facts which, I am bound to add, have been forced upon me by a study of the old religions of civilised humanity. On the one hand, they testify to the continuity of religious thought. God's light lighteth every man that cometh into the world, and the religions of Egypt and Babylonia illustrate the words of the evangelist. They form, as it were, the background and preparation for Judaism and Christianity; Christianity is the fulfilment, not of the Law only, but of all that was truest and best in the religions of the ancient world. In it the beliefs and aspirations of Egypt and Babylonia have found their explanation and fulfilment. But, on the other hand, between Judaism and the coarsely poly-
theistic religion of Babylonia, as also between Christianity and the old Egyptian faith,—in spite of its high morality and spiritual insight,—there lies an impassable gulf. And for the existence of this gulf I can find only one explanation, unfashionable and antiquated though it be. In the language of a former generation, it marks the dividing-line between revelation and unrevealed religion. It is like that "something," hard to define, yet impossible to deny, which separates man from the ape, even though on the physiological side the ape may be the ancestor of the man.

THE RELIGION OF ANCIENT EGYPT.

LECTURE 1.

INTRODUCTION.

It was with a considerable amount of diffidence that I accepted the invitation to deliver a course of lectures before this University, in accordance with the terms of Lord Gifford's bequest. Not only is the subject of them a wide and comprehensive one; it is one, moreover, which is full of difficulties. The materials upon which the lectures must be based are almost entirely monumental: they consist of sculptures and paintings, of objects buried with the dead or found among the ruins of temples, and, above all, of texts written in languages and characters which only a century ago were absolutely unknown. How fragmentary and mutilated such materials must be, I need hardly point out. The Egyptian or Babylonian texts we possess at present are but a tithe of those which once existed, or even of those which will yet be discovered. Indeed, so far as the Babylonian texts are concerned, a considerable proportion of those which
have already been stored in the museums of Europe and America are still undeciphered, and the work of thoroughly examining them will be the labour of years. And of those which have been copied and translated, the imperfections are great. Not infrequently a text is broken just where it seemed about to throw light on some problem of religion or history, or where a few more words were needed in order to explain the sense. Or again, only a single document may have survived to us out of a long series, like a single chapter out of a book, leading us to form a wholly wrong idea of the author's meaning and the object of the work he had written or compiled. We all know how dangerous it is to explain a passage apart from its context, and to what erroneous conclusions such a practice is likely to lead.

And yet it is with such broken and precarious materials that the student of the religions of the past has to work. Classical antiquity can give us but little help. In the literary age of Greece and Rome the ancient religions of Babylonia and Egypt had passed into their dotage, and the conceptions on which they were founded had been transformed or forgotten. What was left of them was little more than an empty and unintelligible husk, or even a mere caricature. The gods, in whose name the kings of Assyria had gone forth to conquer, and in whose honour Nebuchadrezzar had reared the temples and palaces of Babylon, had degenerated into the patrons of a system of magic; the priests, who had once made and unmade the lords of the East, had become "Chaldaean" fortune-tellers, and the religion and science of Babylonia were remembered only for their connection with astrology. The old tradition had survived in Egypt with less apparent alteration, but even there the continuity of religious belief and teaching was more apparent than real, external rather than internal; and though the
Ptolemies and early Roman emperors rebuilt the temples on the old lines, and allowed themselves to be depicted in the dress of the Pharaohs, making offerings to gods whose very names they could not have pronounced, it was all felt to be but a sham, a dressing up, as it were, in the clothes of a religion out of which all the spirit and life had fled.

Both in Egypt and in Babylonia, therefore, we are thrown back upon the monumental texts which the excavator has recovered from the soil, and the decipherer has pieced together with infinite labour and patience. At every step we are brought face to face with the imperfections of the record, and made aware how much we have to read into the story, how scanty is the evidence, how disconnected are the facts. The conclusions we form must to a large extent be theoretical and provisional, liable to be revised and modified with the acquisition of fresh material or a more skilful combination of what is already known. We are compelled to interpret the past in the light of the present, to judge the men of old by the men of to-day, and to explain their beliefs in accordance with what seem to us the common and natural opinions of civilised humanity.

I need not point out how precarious all such attempts must necessarily be. There is nothing harder than to determine the real character of the religion of a people, even when the religion is still living. We may describe its outward characteristics, though even these are not unfrequently a matter of dispute; but the religious ideas themselves, which constitute its essence, are far more difficult to grasp and define. Indeed, it is not always easy for the individual himself to state with philosophical or scientific precision the religious beliefs which he may hold. Difficult as it is to know what another man believes, it is sometimes quite as difficult to know exactly
what one believes one's self. Our religious ideas and beliefs are a heritage which has come to us from the past, but which has also been influenced and modified by the experiences we have undergone, by the education we have received, and, above all, by the knowledge and tendencies of our age. We seldom attempt to reduce them into a harmonious whole, to reconcile their inconsistencies, or to fit them into a consistent system. Beliefs which go back, it may be, to the ages of barbarism, exist with but little change by the side of others which are derived from the latest revelations of physical science; and our conceptions of a spiritual world are not unfrequently an ill-assorted mixture of survivals from a time when the universe was but a small tract of the earth's surface, with an extinguisher-like firmament above it, and of the ideas which astronomy has given us of illimitable space, with its millions of worlds.

If it is difficult to understand and describe with accuracy the religions which are living in our midst, how much more difficult must it be to understand and describe the religions that have gone before them, even when the materials for doing so are at hand! We are constantly told that the past history of the particular forms of religion which we profess, has been misunderstood and misconceived; that it is only now, for example, that the true history of early Christianity is being discovered and written, or that the motives and principles underlying the Reformation are being rightly understood. The earlier phases in the history of a religion soon become unintelligible to a later generation. If we would understand them, we must have not only the materials in which the record of them has been, as it were, embodied, but also the seeing eye and the sympathetic mind which will enable us to throw ourselves back into the past, to see the world as our forefathers saw it, and to share for a time
in their beliefs. Then and then only shall we be able to realise what the religion of former generations actually meant, what was its inner essence as well as its outer form.

When, instead of examining and describing a past phase in the history of a still existing form of faith, we are called upon to examine and describe a form of faith which has wholly passed away, our task becomes infinitely greater. We have no longer the principle of continuity and development to help us; it is a new plant that we have to study, not the same plant in an earlier period of its growth. The fundamental ideas which form, as it were, its environment, are strange to us; the polytheism of Babylonia, or the animal-worship of Egypt, transports us to a world of ideas which stands wholly apart from that wherein we move. It is difficult for us to put ourselves in the place of those who saw no underlying unity in the universe, no single principle to which it could all be referred, or who believed that the dumb animals were incarnations of the divine. And yet, until we can do so, the religions of the two great cultured nations of the ancient world, the pioneers of the civilisation we enjoy to-day, will be for us a hopeless puzzle, a labyrinth without a clue.

Before that clue can be found, we must divest ourselves of our modernism. We must go back in thought and sympathy to the old Orient, and forget, so far as is possible, the intervening ages of history and development, and the mental and moral differences between the East and the West. I say so far as is possible, for the possibility is relative only. No man can shake off the influences of the age and country of which he is the child; we cannot undo our training and education, or root out the inherited instincts with which we were born. We cannot put back the hand of time, nor can the
Ethiopian change his skin. All we can do is to suppress our own prejudices, to rid ourselves of baseless assumptions and prepossessions, and to interpret such evidence as we have honestly and literally. Above all, we must possess that power of sympathy, that historical imagination, as it is sometimes called, which will enable us to realise the past, and to enter, in some degree, into its feelings and experiences.

The first fact which the historian of religion has to bear in mind is, that religion and morality are not necessarily connected together. The recent history of religion in Western Europe, it is true, has made it increasingly difficult for us to understand this fact, especially in days when systems of morality have been put forward as religions in themselves. But between religion and morality there is not necessarily any close tie. Religion has to do with a power outside ourselves, morality with our conduct one to another. The civilised nations of the world have doubtless usually regarded the power that governs the universe as a moral power, and have consequently placed morality under the sanction of religion. But the power may also be conceived of as non-moral, or even as immoral; the blind law of destiny, to which, according to Greek belief, the gods themselves were subject, was necessarily non-moral; while certain Gnostic sects accounted for the existence of evil by the theory that the creator-god was imperfect, and therefore evil in his nature. Indeed, the cruelties perpetrated by what we term nature have seemed to many so contrary to the very elements of moral law, as to presuppose that the power which permits and orders them is essentially immoral. Zoroastrianism divided the world between a god of good and a god of evil, and held that, under the present dispensation at all events, the god of evil was, on the whole, the stronger power.
It is strength rather than goodness that primitive man admires, worships, and fears. In the struggle for existence, at any rate in its earlier stages, physical strength plays the most important part. The old instinctive pride of strength which enabled our first ancestors to battle successfully against the forces of nature and the beasts of the forest, still survives in the child and the boy. The baby still delights to pull off the wings and legs of the fly that has fallen into its power; and the hero of the playground is the strongest athlete, and not the best scholar or the most virtuous of schoolboys. A sudden outbreak of political fury like that which characterised the French Revolution shows how thin is the varnish of conventional morality which covers the passions of civilised man, and Christian Europe still makes the battlefield its court of final appeal. Like the lower animals, man is still governed by the law which dooms the weaker to extinction or decay, and gives the palm of victory to the strong. In spite of all that moralists may say and preach, power and not morality still governs the world.

We need not wonder, therefore, that in the earliest forms of religion we find little or no traces of the moral element. What we term morality was, in fact, a slow growth. It was the necessary result of life in a community. As long as men lived apart one from the other, there was little opportunity for its display or evolution. But with the rise of a community came also the development of a moral law. In its practical details, doubtless, that law differed in many respects from the moral law which we profess to obey to-day. It was only by slow degrees that the sacredness of the marriage tie or of family life, as we understand it, came to be recognised. Among certain tribes of Esquimaux there is still promiscuous intercourse between the two sexes; and wherever Mohammedanism
extends, polygamy, with its attendant degradation of the woman, is permitted. On the other hand, there are still tribes and races in which polyandry is practised, and the child has consequently no father whom it can rightfully call its own. Until the recent conversion of the Fijians to Christianity, it was considered a filial duty for the sons to kill and devour their parents when they had become too old for work; and in the royal family of Egypt, as among the Ptolemies who entered on its heritage, the brother was compelled by law and custom to marry his sister. Family morality, in fact, if I may use such an expression, has been slower in its development than communal morality; it was in the community and in the social relations of men to one another that the ethical sense was first developed, and it was from the community that the newly-won code of morals was transferred to the family. Man recognised that he was a moral agent in his dealings with the community to which he belonged, long before he recognised it as an individual.

Religion, however, has an inverse history. It starts from the individual, it is extended to the community. The individual must have a sense of a power outside himself, whom he is called upon to worship or propitiate, before he can rise to the idea of tribal gods. The fetish can be adored, the ancestor addressed in prayer, before the family has become the tribe, or promiscuous intercourse has passed into polygamy.

The association of morality and religion, therefore, is not only not a necessity, but it is of comparatively late origin in the history of mankind. Indeed, the union of the two is by no means complete even yet. Orthodox Christianity still maintains that correctness of belief is at least as important as correctness of behaviour, and it is not so long ago that men were punished and done
to death, not for immoral conduct, but for refusing to accept some dogma of the Church. In the eyes of the Creator, the correct statement of abstruse metaphysical questions was supposed to be of more importance than the fulfilment of the moral law.

The first step in the work of bringing religion and morality together was to place morality under the sanction of religion. The rules of conduct which the experiences of social life had rendered necessary or advantageous were enforced by an appeal to the terrors of religious belief. Practices which sinned against the code of social morality were put under the ban of the gods and their ministers, and those who ventured to adopt them were doomed to destruction in this world and the next. The *tapu*, which was originally confined to reserving certain places and objects for the use of the divine powers, was invoked for the protection of ethical laws, or to punish violations of them, and the curse of heaven was called down not only upon the enemy of the tribe, but upon the enemy of the moral code of the tribe as well.

Religion thus became tribal as well as personal; the religious instinct in the individual clothed itself with the forms of social life, and the religious conceptions which had gathered round the life of the family were modified and transferred to the life of the community. It was no longer only a feeling of fear or reverence on the part of the individual which made him bow down before the terrors of the supernatural and obey its behests; to this were now added all the ties and associations connected with the life of a tribe. The ethical element was joined to the religious, and what has been termed the religious instinct or consciousness in the individual man attached itself to the rules and laws of ethical conduct. But the attachment was, in the first instance, more or less
accidental; long ages had to pass before the place of the two elements, the ethical and religious, was reversed, and the religious sanction of the ethical code was exchanged for an ethical sanction of religion. It needed centuries of training before a Christian poet could declare: "He can't be wrong whose life is in the right."

There is yet another danger against which we must guard when dealing with the religions of the past; it is that of confusing the thoughts and utterances of individuals with the common religious beliefs of the communities in which they lived. We are for the most part dependent on literary materials for our knowledge of the faiths of the ancient world, and consequently the danger of which I speak is one to which the historian of religion is particularly exposed. But it must be remembered that a literary writer is, by the very fact of his literary activity, different from the majority of his contemporaries, and that this difference in the ages before the invention of printing was greater than it is to-day. He was not only an educated man; he was also a man of exceptional culture. He was a man whose thoughts and sayings were considered worthy of being remembered, who could think for himself, and whose thoughts were listened to by others. His abilities or genius raised him above the ordinary level; his ideas, accordingly, could not be the ideas of the multitude about him, nor could he, from the nature of the case, express them in the same way. The poets or theologians of Egypt and Babylonia were necessarily original thinkers, and we cannot, therefore, expect to find in their writings merely a reflection of the beliefs or superstitions of those among whom they lived.

To reconstruct the religion of Egypt from the literary works of which a few fragments have come down to us, would be like reconstructing the religion of this country
in the last century from a few tattered pages of Hume or Burns, of Dugald Stewart or Sir Walter Scott. The attempts to show that ancient Egyptian religion was a sublime monotheism, or an enlightened pantheism which disguised itself in allegories and metaphors, have their origin in a confusion between the aspirations of individual thinkers and the actual religion of their time. There are indeed literary monuments rescued from the wreck of ancient Egyptian culture which embody the highest and most spiritual conceptions of the Godhead, and use the language of the purest monotheism. But such monuments represent the beliefs and ideas of the cultured few rather than of the Egyptians as a whole, or even of the majority of the educated classes. They set before us the highest point to which the individual Egyptian could attain in his spiritual conceptions—not the religion of the day as it was generally believed and practised. To regard them as representing the popular faith of Egypt, would be as misleading as to suppose that Socrates or Plato were faithful exponents of Athenian religion.

That this view of the literary monuments of ancient Egypt is correct, can be shown from two concrete instances. On the one side, there is the curious attempt made by Amon-hotep IV., of the Eighteenth Dynasty, to revolutionise Egyptian religion, and to replace the old religion of the State by a sort of monotheistic pantheism. The hymns addressed to the solar disk—the visible symbol of the new God—breathe an exalted spirituality, and remind us of passages in the Hebrew Scriptures. "O God," we read in one of them. "O God, who in truth art the living one, who standest before our eyes; thou created that which was not, thou formest it all"; "We also have come into being through the word of thy mouth."
But all such language was inspired by a cult which was not Egyptian, and which the Egyptians themselves regarded as an insult to their national deity, and a declaration of war against the priesthood of Thebes. Hardly was its royal patron consigned to his tomb when the national hatred burst forth against those who still adhered to the new faith; the temple and city of the solar disk were levelled with the ground, and the body of the heretic Pharaoh himself was torn in pieces. Had the religious productions of the court of Amon-hotep IV. alone survived to us, we should have formed out of them a wholly false picture of the religion of ancient Egypt, and ascribed to it doctrines which were held only by a few individuals at only one short period of its history,—doctrines, moreover, which were detested and bitterly resented by the orthodox adherents of the old creeds.

My other example is taken from a class of literature which exists wherever there is a cultured society and an ancient civilisation. It is the literature of scepticism, of those minds who cannot accept the popular notions of divinity, who are critically contemptuous of time-honoured traditions, and who find it impossible to reconcile the teaching of the popular cult with the daily experiences of life. It is not so much that they deny or oppose the doctrines of the official creed, as that they ignore them. Their scepticism is that of Epicurus rather than of the French encyclopaedists. Let the multitude believe in its gods and its priests, so long as they themselves are not forced to do the same.

Egypt had its literary sceptics like Greece or Rome. Listen, for instance, to the so-called Song of the Harper, written as long ago as the age of the Eleventh Dynasty, somewhere about 2500 B.C. This is how a part of it runs in Canon Rawnsley's metrical translation,
which faithfully preserves the spirit and sense of the original—

"What is fortune? say the wise. 
Vanished are the hearths and homes; 
What he does or thinks, who dies, 
None to tell us comes

Eat and drink in peace to-day, 
When you go your goods remain; 
He who fares the last long way, 
Comes not back again."

The Song of the Harper is not the only fragment of the sceptical literature of Egypt which we possess. At a far later date, a treatise was written in which, under the thinly-veiled form of a fable the dogmas of the national faith were controverted and overthrown. It takes the form of a dialogue between an Ethiopian cat—the representative of all that was orthodox and respectable in Egyptian society—and a jackal, who is made the mouthpiece of heretical unbelief. But it is clear that the sympathies of the author are with the sceptic rather than with the believer; and it is the cat and not the jackal who is worsted in argument. In this first controversy between authority and reason, authority thus comes off second best, and just as Epicurus has a predecessor in the author of the Song of the Harper, so Voltaire has a predecessor in the author of the dialogue.

Here, again, it is obvious that if only these two specimens of Egyptian theological literature had been preserved, we should have carried away with us a very erroneous idea of ancient Egyptian belief—or unbelief. Who could have imagined that the Egyptians were a people who had elaborated a minutely-detailed description of the world beyond the grave, and who believed

1 Notes for the Nile, pp. 188, 189.
2 Révillout in the Revue égyptologique, i. 4, ii. 3.
more intensely perhaps than any other people has done either before or since in a future life? Who could have supposed that their religion inculcated a belief not only in the immortality of the soul or spirit, but in the resurrection of the body as well; and that they painted the fields of the blessed to which they looked forward after death as a happier and a sunnier Egypt, a land of light and gladness, of feasting and joy? We cannot judge what Egyptian religion was like merely from the writings of some of its literary men, or build upon them elaborate theories as to what priest and layman believed. In dealing with the fragments of Egyptian literature, we must ever bear in mind that they represent, not the ideas of the mass of the people, but the conceptions of the cultured few.

But there is still another error into which we may fall. It is that of attaching too literal a meaning to the language of theology. The error is the natural result of the reaction from the older methods of interpretation, which found allegories in the simplest of texts, and mystical significations in the plainest words. The application of the scientific method to the records of the past brought with it a recognition that an ancient writer meant what he said quite as much as a writer of to-day, and that to read into his language the arbitrary ideas of a modern hierophant might be an attractive pastime, but not a serious occupation. Before we can hope to understand the literature of the past, we must try to discover what is its literal and natural meaning, unbiassed by prejudices or prepossessions, or even by the authority of great names. Theologians have been too fond of availing themselves of the ambiguities of language, and of seeing in a text more than its author either knew or dreamt of. Unless we have express testimony to the contrary, it is no more permissible to find parables and
metaphorical expressions in an old Egyptian book than it is in the productions of the modern press.

But, on the other hand, it is possible to press this literalism too far. Language, it has been said, is a storehouse of faded metaphors; and if this is true of language in general, it is still more true of theological language. We can understand the spiritual and the abstract only through the help of the material; the words by which we denote them must be drawn, in the first instance, from the world of the senses. Just as in the world of sense itself the picture that we see or the music that we hear comes to us through the nerves of sight and hearing, so all that we know or believe of the moral and spiritual world is conveyed to us through sensuous and material channels. Thought is impossible without the brain through which it can act, and we cannot convey to others or even to ourselves our conceptions of right and wrong, of beauty and goodness, without having recourse to analogies from the world of phenomena, to metaphor and imagery, to parable and allegory. What is “conception” itself but a “grasping with both hands,” or “parable” but a “throwing by the side of”? If we would deal with the spiritual and moral, we must have recourse to metaphorical forms of speech. A religion is necessarily built up on a foundation of metaphor.

To interpret such metaphors in their purely natural sense would therefore land us in gross error. Unfortunately, modern students of the religious history of the past have not always been careful to avoid doing so. Misled by the fact that language often enshrines old beliefs and customs which have otherwise passed out of memory, they have forgotten that a metaphor is not necessarily a survival, or a survival a metaphor. In the hieroglyphs discovered in the Pyramids of the
sixth Egyptian dynasty, Sahu or Orion, the huntsman of the skies, is said to eat the great gods in the morning, the lesser gods at noon and the smaller ones at night, roasting their flesh in the vast ovens of the heavens; and it has been hastily concluded that this points to a time when the ancestors of the historical Egyptians actually did eat human flesh. It would be just as reasonable to conclude from the language of the Eucharistic Office that the members of the Christian Church were once addicted to cannibalism. Eating and drinking are very obvious metaphors, and there are even languages in which the word “to eat” has acquired the meaning “to exist.”

I remember hearing of a tribe who believed that we worshipped a lamb because of the literal translation into their language of the phrase, “O Lamb of God.” Theology is full of instances in which the language it uses has been metaphorical from the outset, and the endeavour to interpret it with bald literality, and to see in it the fossilised ideas and practices of the past, would end in nothing but failure. Christianity is not the only religion which has consciously employed parable for inculcating the truths it professes to teach. Buddhism has done the same, and the “Parables of Buddhagosha” have had a wider influence than all the other volumes of the Buddhist Canon.

Survivals there undoubtedly are in theological language as in all other forms of language, and one of the hardest tasks of the student of ancient religion is to determine where they really exist. Is the symbolism embodied in a word or an expression of primary or secondary origin?

For the extraordinary variety of senses in which the verb ye, “to eat,” has come to be used in the African language of Akra, see Pott, *Ueber die Verschiedenheit des menschlichen Sprachbaues von Wilhelm von Humboldt*, ii. pp. 495-498 (1876). Thus ye no, “to be master,” is literally “to eat the upper side”; ye gbi, “to live” or “exist,” is literally “to eat a day”; fei ye, “to be cold,” is “to eat cold.”
Was it from the very beginning a symbol and metaphor intended to be but the sensuous channel through which some perception of divine truth could be conveyed to us, or does it reflect the manners and thought of an earlier age of society, which has acquired a symbolical significance with the lapse of centuries? When the primitive Aryan gave the Being whom he worshipped the name of Dyaus, from a root which signified "to be bright," did he actually see in the bright firmament the divinity he adored, or was the title a metaphorical one expressive only of the fact that the power outside himself was bright and shining like the sun? The Babylonians pictured their gods in the image of man: did Babylonian religion accordingly begin with the worship of deified ancestors, or were the human figures mere symbols and images denoting that the highest conception man could form of his creator was that of a being like himself? The answer to these questions, which it has been of late years the fashion to seek in modern savagery, is inconclusive. It has first to be proved that modern savagery is not due to degeneration rather than to arrested development, and that the forefathers of the civilised nations of the ancient world were ever on the same level as the savage of to-day. In fact the savage of to-day is not, and cannot be, a representative of primitive man. If the ordinary doctrine of development is right, primitive man would have known nothing of those essentials of human life and progress of which no savage community has hitherto been found to be destitute. He would have known nothing of the art of producing fire, nothing of language, without which human society would be impossible. On the other hand, if the civilised races of mankind possessed from the outset the germs of culture and the power to develop it, they can in no way be compared with the savages of the modern world, who
have lived, generation after generation, stationary and unprogressive, like the beasts that perish, even though at times they may have been in contact with a higher civilisation. To explain the religious beliefs and usages of the Greeks and Romans from the religious ideas and customs of Australians or Hottentots, is in most cases but labour in vain; and to seek the origin of Semitic religion in the habits and superstitions of low-caste Bedâwin, is like looking to the gipsies for an explanation of European Christianity. Such a procedure is the abuse, not the use, of the anthropological method. Folk-lore gives us a key to the mind of the child, and of the child-like portion of society; it sheds no light on the beginnings either of religion or of civilisation, and to make it do so is to mistake a will-o'-the-wisp for a beacon-light. It is once more to find "survivals" where they exist only in the mind of the inquirer. So long as civilised society has lasted, it has contained the ignorant as well as the learned, the fool as well as the wise man, and we are no more justified in arguing from the ignorance of the past than we should be in arguing from the ignorance of the present. So far as folk-tales genuinely reflect the mind of the unlearned and childlike only, they are of little help to the student of the religions of the ancient civilised world.

We must, then, beware of discovering allegory and symbol where they do not exist; we must equally beware of overlooking them where they are actually to be found. And we must remember that, although the metaphors and symbolism of the earlier civilisations are not likely to be those which seem natural to the modern European, this is no reason why we should deny the existence of them. In fact, without them religious language and beliefs are impossible; it is only through the world of the senses that a way lies to a knowledge
of the world beyond. The conditions into which we were born necessitate our expressing and realising our mental, moral, and religious conceptions through sensuous imagery and similitude. Only we must never forget that the imagery is not the same for different races or generations of mankind.

Before concluding, I must say a few words in explanation of the title I have given to the course of lectures I have the honour of delivering before you. It is not my intention to give a systematic description or analysis of the ancient religions of the civilised East. That would hardly be in keeping with the terms of Lord Gifford's bequest, nor would the details be interesting, except to a small company of specialists. Indeed, in the case of the ancient religion of Babylonia, the details are still so imperfect and disputed, that a discussion of them is fitted rather for the pages of a learned Society's journal than for a course of lectures. What the lecturer has to do is to take the facts that have been already ascertained, to see to what conclusions they point, and to review the theories which they countenance or condemn. The names and number of the gods and goddesses worshipped by the Egyptians and Babylonians is of little moment to the scientific student of religion: what he wants to know is the conception of the deity which underlay these manifold forms, and the relation in which man was believed to stand to the divine powers around him. What was it that the civilised Babylonian or Egyptian meant by the term "god"? What was the idea or belief that lay behind the polytheism of the popular cult, and in what respects is it marked off from the ideas and beliefs that rule the religions of our modern world? The old Egyptian, indeed, might not have understood what we mean by "polytheism" and "monotheism," but would he not have already recognised the two
tendencies of thought which have found expression among us in these words? Was St. Paul right when he declared that the old civilised nations had sought after the God of Christianity, "if haply they might feel after Him and find Him," or is there an impassable gulf between the religious conceptions of paganism and those of Christian Europe? Such are some of the questions to whose solution I trust that the facts I have to bring before you may contribute, in however humble a degree.
LECTURE II.

EGYPTIAN RELIGION.

It is through its temples and tombs that ancient Egypt is mainly known to us. It is true that the warm and rainless climate of Upper Egypt has preserved many of the objects of daily life accidentally buried in the ruins of its cities, and that even fragments of fragile papyrus have come from the mounds that mark the sites of its villages and towns; but these do not constitute even a tithe of the monuments upon which our present knowledge of ancient Egyptian life and history has been built. It is from the tombs and temples that we have learned almost all we now know about the Egypt of the past. The tombs were filled with offerings to the dead and illustrations of the daily life of the living, while their walls were adorned with representations of the scenes at which their possessor had been present, with the history of his life, or with invocations to the gods. The temples were storehouses of religious lore, which was sculptured or painted on their walls and ceilings. In fact, we owe most of our knowledge of ancient Egypt to the gods and to the dead; and it is natural, therefore, that the larger part of it should be concerned with religion and the life to come.

We are thus in an exceptionally good position for ascertaining, at all events in outline, the religious ideas of the old Egyptians, and even for tracing their history through long periods of time. The civilisation of Egypt
The religion of Ancient Egypt goes back to a remote past, and recent discoveries have carried us almost to its beginnings. The veil which so long covered the origin of Egyptian culture is at last being drawn aside, and some of the most puzzling inconsistencies in the religion, which formed so integral a part of that culture, are being explained. We have learnt that the religion of the Egypt which is best known to us was highly composite, the product of different races and different streams of culture and thought; and the task of uniting them all into a homogeneous whole was never fully completed. To the last, Egyptian religion remained a combination of ill-assorted survivals rather than a system, a confederation of separate cults rather than a definite theology. Like the State, whatever unity it possessed was given to it by the Pharaoh, who was not only a son and representative of the sun-god, but the visible manifestation of the sun-god himself. Its unity was thus a purely personal one: without the Pharaoh the Egyptian State and Egyptian religion would alike have been dissolved into their original atoms.

The Pharaonic Egyptians—the Egyptians, that is to say, who embanked the Nile, who transformed the marsh and the desert into cultivated fields, who built the temples and tombs, and left behind them the monuments we associate with Egyptian culture—seem to have come from Asia; and it is probable that their first home was in Babylonia. The race (or races) they found in the valley of the Nile were already possessed of a certain measure of civilisation. They were in an advanced stage of neolithic culture; their flint tools are among the finest that have ever been made; and they were skilled in the manufacture of vases of the hardest stone. But they were pastoral rather than agricultural, and they lived in the desert rather than on the river-bank. They proved no match for the newcomers, with their weapons of
copper; and, little by little, the invading race succeeded in making itself master of the valley of the Nile, though tradition remembered the fierce battles which were needed before the "smiths" who followed Horus could subjugate the older population in their progress from south to north.

How far the invaders themselves formed a single race is still uncertain. Some scholars believe that, besides the Asiatics who entered Egypt from the south, crossing the Red Sea and so marching through the eastern desert to the Nile, there were other Asiatics who came overland from Mesopotamia, and made their way into the Delta across the isthmus of Suez. Of this overland invasion, however, I can myself see no evidence; so far as our materials at present allow us to go, the Egyptians of history were composed, at most, of three elements, the Asiatic invaders from the south, and two older races, which we may term aboriginal. One of them Professor Petrie is probably right in maintaining to be Libyan.¹

We thus have at least three different types of religious belief and practice at the basis of Egyptian religion, corresponding with the three races which together made up the Egyptian people. Two of the types would be African; the third would be Asiatic, perhaps Babylonian. From the very outset, therefore, we must be prepared to find divergences of religious conception as well as divergences in rites and ceremonies. And such divergences can be actually pointed out.²

The practice of embalming, for instance, is one which we have been accustomed to think peculiarly characteristic of ancient Egypt. It is referred to in the Book of

² See W. M. Flinders Petrie, Religion and Conscience in Ancient Egypt, 1898.
Genesis, and described by classical writers. There are many people whose acquaintance with the old Egyptians is confined to the fact that when they died their bodies were made into mummies. It is from the wrappings of the mummy that most of the small amulets and scarabs have come which fill so large a space in collections of Egyptian antiquities, as well as many of the papyri which have given us an insight into the literature of the past. We have been taught to believe that from times immemorial the Egyptians mummified their dead, and that the practice was connected with an equally immemorial faith in the resurrection of the dead; and yet recent excavations have made it clear that such a belief is erroneous. Mummification was never universal in Egypt, and there was a time when it was not practised at all. It was unknown to the prehistoric populations whom the Pharaonic Egyptians found on their arrival in the country; and among the Pharaonic Egyptians themselves it seems to have spread only slowly. Few traces of it have been met with before the age of the Fourth and Fifth Dynasties, if, indeed, any have been met with at all.

But, as we shall see hereafter, the practice of mummification was closely bound up with a belief in the resurrection of the dead. The absence of it accordingly implies that this belief was either non-existent, or, at all events, did not as yet occupy a prominent place in the Egyptian creed. Like embalming, it must have been introduced by the Pharaonic Egyptians; it was not until the older races of the country had been absorbed by their conquerors that mummification became general, along with the religious ideas that were connected with it. Before the age of the Eighteenth Dynasty it seems to have been practically confined to the court and the official priesthood.
On the other hand, one at least of the prehistoric races appears to have practised secondary burial. The skeletons discovered in its graves have been mutilated in an extraordinary manner. The skull, the legs, the arms, the feet, and the hands have been found dis-severed from the trunk; even the backbone itself is sometimes broken into separate portions; and there are cases in which the whole skeleton is a mere heap of dismembered bones. But, in spite of this dismemberment, the greatest care has been taken to preserve the separate fragments, which are often placed side by side. An explanation of the dismemberment has been sought in cannibalism, but cannibals do not take the trouble to collect the bones of their victims and bury them with all the marks of respect; moreover, the bones have not been gnawed except in one or two examples, where wild beasts rather than man must have been at work. It seems evident, therefore, that the race whose dismembered remains have thus been found in so many of the prehistoric cemeteries of Egypt, allowed the bodies of the dead to remain unburied until the flesh had been stripped from their bones by the birds and beasts of prey, and that it was only when this had been done that the sun-bleached bones were con-signed to the tomb. Similar practices still prevail in certain parts of the world; apart from the Parsi "towers of silence," it is still the custom in New Guinea to leave the corpse among the branches of a tree until the flesh is entirely destroyed.1

1 "The custom of dismembering the body or stripping it of its flesh is widely spread: the neolithic tombs of Italy contain skulls and bones which have been painted red; Baron de Baye has found in the tombs of Champagne skeletons stripped of their flesh, and the Patagonians and Andamanners as well as the New Zealanders still practise the custom" (De Morgan, Recherches sur les Origines de l'Egypte, ii. p. 142). Secondary burial is met with in India among the Kullons, the Kathkaris, and the
Between mummification and secondary burial no reconciliation is possible. The conceptions upon which the two practices rest are contradictory one to the other. In the one case every effort is made to keep the body intact and to preserve the flesh from decay; in the other case the body is cast forth to the beasts of the desert and the fowls of the air, and its very skeleton allowed to be broken up. A people who practised secondary burial can hardly have believed in a future existence of the body itself. Their belief must rather have been in the existence of that shadowy, vapour-like form, comparable to the human breath, in which so many races of mankind have pictured to themselves the imperishable part of man. It was the misty ghost, seen in dreams or detected at night amid the shadows of the forest, that survived the death of the body; the body itself returned to the earth from whence it had sprung.

This prehistoric belief left its traces in the official religion of later Egypt. The **Ba** or "Soul," with the figure of a bird and the head of a man, is its direct descendant. As we shall see, the conception of the **Ba** fits but ill with that of the mummy, and the harmonistic efforts of a later date were unable altogether to hide the inner contradiction that existed between them. The soul, which fled on the wings of a bird to the world beyond the sky, was not easily to be reconciled with the mummified body which was eventually to lead a life in the other world that should be a repetition and reflection of its life in this. How the **Ba** and the mummy were to be united, the official cult never

---

Agariya, as well as in Motu, Melanesia, Sarawak, the Luchu Islands, Torres Straits, and Ashanti, while "in some of the English long barrows the bones appear to have been flung in pell-mell" (Crooke in *Journal of the Anthropological Institute*, xxix. pp. 284–286 (1899)).
endeavoured to explain; the task was probably beyond its powers. It was content to leave the two conceptions side by side, bidding the individual believer reconcile them as best he could.

The fact illustrates another which must always be kept in mind in dealing with Egyptian religion. Up to the last it remained without a philosophic system. There were, it is true, certain sides of it which were reduced to systems, certain parts of the official creed which became philosophies. But as a whole it was a loosely-connected agglomeration of beliefs and practices which had come down from the past, and one after the other had found a place in the religion of the State. No attempt was ever made to form them into a coherent and homogeneous whole, or to find a philosophic basis upon which they all might rest. Such an idea, indeed, never occurred to the Egyptian. He was quite content to take his religion as it had been handed down to him, or as it was prescribed by the State; he had none of that inner retrospection which distinguishes the Hindu, none of that desire to know the causes of things which characterised the Greek. The contradictions which we find in the articles of his creed never troubled him; he never perceived them, or if he did they were ignored. He has left to us the task of finding a philosophic basis for his faith, and of fixing the central ideas round which it revolved; the task is a hard one, and it is rendered the harder by the imperfection of our materials.

The Egyptian was no philosopher, but he had an immense veneration for the past. The past, indeed, was ever before him; he could not escape from it. Objects and monuments which would have perished in other countries were preserved almost in their pristine freshness by the climate under which he lived. As to-day, so too in the age of the Pharaohs, the earliest
and the latest of things jostled one another, and it was often difficult to say which of the two looked the older. The past was preserved in a way that it could not be elsewhere; nothing perished except by the hand of man. And man, brought up in such an atmosphere of continuity, became intensely conservative. Nature itself only increased the tendency. The Nile rose and fell with monotonous regularity; year after year the seasons succeeded each other without change; and the agriculturist was not dependent on the variable alternations of rain and sunshine, or even of extreme heat and cold. In Egypt, accordingly, the new grew up and was adopted without displacing the old. It was a land to which the rule did not apply that "the old order changeth, giving place to new." The old order might, indeed, change, through foreign invasion or the inventions of human genius, but all the same it did not give place to the new. The new simply took a place by the side of the old.

The Egyptian system of writing is a striking illustration of the fact. All the various stages through which writing must pass, in its development out of pictures into alphabetic letters, exist in it side by side. The hieroglyphs can be used at once ideographically, syllabically, and alphabetically. And what is true of Egyptian writing is true also of Egyptian religion. The various elements out of which it arose are all still traceable in it; none of them has been discarded, however little it might harmonise with the elements with which it has been combined. Religious ideas which belong to the lowest and to the highest forms of the religious consciousness, to races of different origin and different age, exist in it side by side.

It is true that even in organised religions we find similar combinations of heterogeneous elements. Sur-
vivals from a distant past are linked in them with the conceptions of a later age, and beliefs of divergent origin have been incorporated by them into the same creed. But it is a definite and coherent creed into which they have been embodied; the attempt has been made to fuse them into a harmonious whole, and to explain away their apparent divergencies and contradictions. Either the assertion is made that the creed of the present has come down unchanged from the past, or else it is maintained that the doctrines and rites of the past have developed normally and gradually into those of the present.

But the Egyptian made no such endeavour. He never realised that there was any necessity for making it. It was sufficient that a thing should have descended to him from his ancestors for it to be true, and he never troubled himself about its consistency with other parts of his belief. He accepted it as he accepted the inconsistencies and inequalities of life, without any effort to work them into a harmonious theory or form them into a philosophic system. His religion was like his temples, in which the art and architecture of all the past centuries of his history existed side by side. All that the past had bequeathed to him must be preserved, if possible; it might be added to, but not modified or destroyed.

It is curious that the same spirit has prevailed in modern Egypt. The native never restores. If a building or the furniture within it goes to decay, no attempt is made to mend or repair it; it is left to moulder on in the spot where it stands, while a new building or a new piece of furniture is set up beside it. That the new and the old should not agree together—should, in fact, be in glaring contrast—is a matter of no moment. This veneration for the past, which preserves without repairing
or modifying or even adapting to the surroundings of the present, is a characteristic which is deeply engrained in the mind of the Egyptian. It had its prior origin in the physical and climatic conditions of the country in which he was born, and has long since become a leading characteristic of his race.

Along with the inability to take a general view of the beliefs he held, and to reduce them to a philosophic system, went an inability to form abstract ideas. This inability, again, may be traced to natural causes. Thanks to the perpetual sunshine of the valley of the Nile, the Egyptian leads an open-air life. Except for the purpose of sleep, his house is of little use to him, and in the summer months even his sleep is usually taken on the roof. He thus lives constantly in the light and warmth of a southern sun, in a land where the air is so dry and clear that the outlines of the most distant objects are sharp and distinct, and there is no melting of shadow into light, such as characterises our northern climes. Everything is clear; nothing is left to the imagination; and the sense of sight is that which is most frequently brought into play. It is what the Egyptian sees rather than what he hears or handles that impresses itself upon his memory, and it is through his eyes that he recognises and remembers.

At the same time this open-air life is by no means one of leisure. The peculiar conditions of the valley of the Nile demand incessant labour on the part of its population. Fruitful as the soil is when once it is watered, without water it remains a barren desert or an unwholesome marsh. And the only source of water is the river Nile. The Nile has to be kept within its banks, to be diverted into canals, or distributed over the fields by irrigating machines, before a single blade of wheat can grow or a single crop be gathered in. Day
after day must the Egyptian labour, repairing the dykes and canals, ploughing the ground, planting the seed, and incessantly watering it; the Nile is ready to take advantage of any relaxation of vigilance and toil, to submerge or sweep away the cultivated land, or to deny to it the water that it needs. Of all people the Egyptian is the most industrious; the conditions under which he has to till the soil oblige him to be so, and to spend his existence in constant agricultural work.

But, as I have already pointed out, this work is monotonously regular. There are no unexpected breaks in it; no moments when a sudden demand is made for exceptional labour. The farmer's year is all mapped out for him beforehand: what his forefathers have done for unnumbered centuries before him, he too has to do almost to a day. It is steady toil, day after day, from dawn to night, during the larger portion of the year.

This steady toil in the open air gives no opportunity for philosophic meditation or introspective theorising. On the contrary, life for the Egyptian fellah is a very real and practical thing: he knows beforehand what he has to do in order to gain his bread, and he has no time in which to theorise about it. It is, moreover, his sense of sight which is constantly being exercised. The things which he knows and remembers are the things which he sees, and he sees them clearly in the clear sunshine of his fields.

We need not wonder, therefore, that the ancient Egyptian should have shown on the one hand an incapacity for abstract thought, and on the other hand a love of visible symbols. The two, in fact, were but the reverse sides of the same mental tendency. Symbolism, indeed, is always necessary before we can apprehend the abstract: it is only through the sensuous symbol that we can express the abstract thought. But
the Egyptian did not care to penetrate beyond the expression. He was satisfied with the symbol which he could see and remember, and the result was that his religious ideas were material rather than spiritual. The material husk, as it were, sufficed for him, and he did not trouble to inquire too closely about the kernel within. The soul was for him a human-headed bird, which ascended on its wings to the heavens above; and the future world itself was but a duplicate of the Egypt which his eyes gazed upon below.

The hieroglyphic writing was at once an illustration and an encouragement of this characteristic of his mind. All abstract ideas were expressed in it by symbols which he could see and understand. The act of eating was denoted by the picture of a man with his hand to his mouth, the idea of wickedness by the picture of a sparrow. And these symbolic pictures were usually attached to the words they represented, even when the latter had come to be syllabically and alphabetically spelt. Even in reading and writing, therefore, the Egyptian was not required to concern himself overmuch with abstract thought. The concrete symbols were ever before his eyes, and it was their mental pictures which took the place for him of abstract ideas.

It must, of course, be remembered that the foregoing generalisations apply to the Egyptian people as a whole. There were individual exceptions; there was even a class the lives of whose members were not devoted to agricultural or other labour, and whose religious conceptions were often spiritual and sublime. This was the class of priests, whose power and influence increased with the lapse of time, and who eventually moulded the official theology of Egypt. Priestly colleges arose in the great sanctuaries of the country, and gradually absorbed a considerable part of its land and revenues. At first the
priests do not seem to have been a numerous body, and up to the last the higher members of the hierarchy were comparatively few. But in their hands the religious beliefs of the people underwent modification, and even a rudimentary systematisation; the different independent cults of the kingdom were organised and combined together, and with this organisation came philosophic speculation and theorising. If Professor Maspero is right, the two chief schools of religious thought and systematising in early Egypt were at Heliopolis, near the apex of the Delta, and Hermopolis, the modern Eshmunên, in Central Egypt. In Hermopolis the conception of creation, not by voice merely, but even by the mere sound of the voice, was first formed and worked out while Heliopolis was the source of that arrangement of the deities into groups of nine which led to the identification of the gods one with another, and so prepared the way for monotheism.\(^1\) If Heliopolis were indeed, as seems probable, the first home of this religious theory, its influence upon the rest of Egypt was profound. Already in the early part of the historical period, in the age of the Fifth and Sixth Dynasties, when the religious texts of the Pyramids were compiled, the scheme which placed the Ennead or group of nine at the head of the Pantheon had been accepted throughout the country. It was the beginning of an inevitable process of thought, which ended by resolving the deities of the official cult into forms or manifestations one of the other, and by landing its adherents in pantheism.

To a certain extent, therefore, the general incapacity for abstract thought which distinguished the Egyptians did not hold good of the priestly colleges. But even among the priests the abstract was never entirely dissociated

\(^1\) See Maspero, *Études de Mythologie et d'Archéologie égyptiennes*, ii. p. 372 sqq.
from the symbol. Symbolism still dominates the profoundest thoughts and expressions of the later inscriptions; the writer cannot free himself from the sensuous image, except perhaps in a few individual cases. At the most, Egyptian thought cannot rise further than the conception of "the god who has no form"—a confession in itself of inability to conceive of what is formless. It is true that after the rise of the Eighteenth Dynasty the deity is addressed as Kheper zes-ef, "that which is self-grown," "the self-existent"; but when we find the same epithet applied also to plants like the balsam and minerals like saltpetre, it is clear that it does not possess the abstract significance we should read into it to-day. It simply expresses the conviction that the god to whom the prayer is offered is a god who was never born in human fashion, but who grew up of himself, like the mineral which effloresces from the ground, or the plant which is not grown from seed. Similarly, when it is said of him that he is "existent from the beginning,"—kheper em hat,—or, as it is otherwise expressed, that he is "the father of the beginning," the phrase is less abstract than it seems at first sight to be. The very word kheper or "existent" denotes the visible universe, while hat or "beginning" is the hinder extremity. The phrase can be pressed just as little as the epithet "lord of eternity," applied to deities whose birth and death are nevertheless asserted in the same breath. Perhaps the most abstract conception of the divine to which the Egyptian attained was that of "the nameless one," since the name was regarded as something very real and concrete, as, in fact, the essence of that to which it belonged. To say, therefore, that a thing was nameless, was equivalent to either denying its existence or to lifting it out of the world of the concrete altogether.

There was a moment in the history of Egypt when
an attempt was made to put a real signification into the apparently abstract terms and phrases addressed to the gods. The Pharaoh Khu-n-Aten, towards the close of the Eighteenth Dynasty, appears suddenly on the scene as a royal reformer, determined to give life and meaning to the language which had described the supreme deity as " the sole and only god," the absolute ruler of the universe, who was from all eternity, and whose form was hidden from men. But the impulse to the reform came from Asia. Khu-n-Aten's mother was a foreigner, and his attempt to engraft Asiatic ideas upon Egyptian religion, or rather to substitute an Asiatic form of faith for that of his fathers, proved a failure. The worship of the one supreme deity, whose visible symbol was the solar disc, though enforced by persecution and by all the power of the Pharaoh himself, hardly survived his death. Amon of Thebes and his priesthood came victorious out of the struggle, and the pantheistic monotheism of Khu-n-Aten was never revived. Symbolism remained, while the abstract thought, to which that symbolism should have been a stepping-stone, failed to penetrate into Egyptian religion. The Egyptian continued to be content with the symbol, as his father had been before him. But in the priestly colleges and among the higher circles of culture it became less materialistic; while the mass of the people still saw nothing but the symbol itself, the priests and scribes looked as it were beyond it, and saw in the symbol the picture of some divine truth, the outward garment in which the deity had clothed himself. What constituted, however, the peculiarity of the Egyptian point of view was, that this outward garment was never separated from that which it covered; it was regarded as an integral part of the divine essence, which could no more be dissociated from it than the surface of a statue can be dissociated from the stone of which it
is made. The educated Egyptian came to see in the multitudinous gods of the public worship merely varying manifestations or forms of one divine substance; but still they were manifestations or forms visible to the senses, and apart from such forms the divine substance had no existence. It is characteristic that the old belief was never disavowed, that images were actually animated by the gods or human personalities whose likeness they bore, and whom they were expressively said to have "devoured"; indeed, the king still received the Sa or principle of immortality from contact with the statue of the god he served; and wonder-working images, which inclined the head towards those who asked them questions, continued to be consulted in the temples.¹ At Dendera the soul of the goddess Hathor was believed to descend from heaven in the form of a hawk of lapis-lazuli in order to vivify her statue;² and the belief is a significant commentary on the mental attitude of her worshippers.

One result of the Egyptian’s inability or disinclination for abstract thought was the necessity not only of representing the gods under special and definite forms, but even of always so thinking of them. The system of writing, with its pictorial characters, favoured the habit; and we can well understand how difficult the most educated scribe must have found it to conceive of Thoth otherwise than as an ibis, or of Hathor otherwise than as a cow. Whatever may have been the origin of the Egyptian worship of animals, or—which is something very different—of the identification of certain individual animals with the principal gods, its continuance was materially assisted by the sacred writing of the scribes.

¹ See Maspero, *Études de Mythologie et l'Archéologie égyptiennes*, i. p. 85 sqq.
² Mariette, *Dendérah, Texte*, p. 156.
and the pictures that adorned the walls of the temples. To the ordinary Egyptian, Thoth was indeed an ibis, and the folk-lore of the great sanctuaries accordingly described him as such. But to the cultured Egyptian, also, the ibis was his symbol; and in Egypt, as we have seen, the symbol and what is symbolised were apt to be confounded together.

The beast-worship of Egypt excited the astonishment and ridicule of the Greeks and Romans, and the unmeasured scorn of the Christian apologists. I shall have to deal with it in a later lecture. For the present it is sufficient to point out how largely it owed its continued existence to the need for symbolism which characterised Egyptian thought, in spite of the fact that there was another and contradictory conception which held sway within Egyptian religion. This was the conception of the divinity of man, which found its supreme expression in the doctrine that the Pharaoh was the incarnation of the sun-god. It was not in the brute beast, but in man himself, that the deity revealed himself on earth.

The origin of the conception must be sought in the early history of the country. Egypt was not at first the united monarchy it afterwards became. It was divided into a number of small principalities, each independent of the other and often hostile. It is probable that in some cases the inhabitants of these principalities did not belong to the same race; that while in one the older population predominated, in another the Pharaonic Egyptians held absolute sway. At all events the manners and customs of their inhabitants were not uniform, any more than the religious beliefs they held and the rites they practised. The god who was honoured in one place

1 In the Pyramid texts the dead are described as being carried across the lake which separates this world from the fields of Alu, on the wings of Thoth.
was abhorred in another, and a rival deity set over against him.

True to its conservative principles, Egypt never forgot the existence of these early principalities. They continued to survive in a somewhat changed form. They became the nomes of Pharaonic Egypt, separate districts resembling to a certain degree the States of the American Republic, and preserving to the last their independent life and organisation. Each nome had its own capital, its own central sanctuary, and its own prince; above all, it had its own special god or goddess, with their attendant deities, their college of priests, their ceremonies and their festivals. Up to the age of the Hyksos conquest the hereditary princes of the nomes were feudal lords, owning a qualified obedience to the Pharaoh, and furnishing him with tribute and soldiers when called upon to do so. It was not till after the rise of the Eighteenth Dynasty that the old feudal nobility was replaced by court officials and a bureaucracy which owed its position to the king; and even then the descendants of the ancient princes were ever on the watch to take advantage of the weakness of the central authority and recover the power they had lost. Up to the last, too, the gods of the several nomes preserved a semblance of their independent character. It was only with the rise of the new kingdom and the accession of the Eighteenth Dynasty that that process of fusion set in to any real purpose which identified the various deities one with another, and transformed them into kaleidoscopic forms of Amon or Ra. The loss of their separate and independent character went along with the suppression of the feudal families with whom their worship had been associated for unnumbered generations. The feudal god and the feudal prince disappeared together: the one became absorbed into the supreme god of the Pharaoh and his
priests, the other into a functionary of the court. It was only in the hearts and minds of the people that Thoth remained what he had always been, the lord and master of Hermopolis, and of Hermopolis alone.

The principalities of primitive Egypt gradually became unified into two or three kingdoms, and eventually into two kingdoms only, those of Upper and Lower Egypt. Recent discoveries have thrown unexpected light on this early period of history. At one time the capital of the southern kingdom was Nekhen, called Hierakonpolis in the Greek period, the site of which is now represented by the ruins of Kom el-Ahmar, opposite El-Kab. Here, among the foundations of the ancient temple, Mr. Quibell has found remains which probably go back to an age before that of Menes and the rise of the united Egyptian monarchy. Among them are huge vases of alabaster and granite, which were dedicated by a certain king Besh in the year when he conquered the people of Northern Egypt. On the other hand, on a stela now at Palermo a list is given of kings who seem to have reigned over Northern Egypt while the Pharaohs of Nekhen were reigning in the south.¹

For how many centuries the two kingdoms existed side by side, sometimes in peaceful intercourse, sometimes in hostile collision, it is impossible to say. The fact that Egypt had once been divided into two kingdoms was never forgotten; down to the last days of the Egyptian monarchs the Pharaoh bore the title of "lord of the two lands," and on his head was placed the two-fold crown of Upper and Lower Egypt. Nekhen was under the protection not only of Horus, the god of the Pharaonic Egyptians, but also of Nekhbit, the tutelary goddess of the whole of the southern land. From the Cataract northward her dominion extended, but it was

¹ See Sethe in the *Zeitschrift für Aegyptischer Sprache*, 1897, 1.
at El-Kab opposite Nekhen, where the road from the Red Sea and the mines of the desert reached the Nile, that her special sanctuary stood. Besh calls himself on his vases “the son of Nekhbit”; and even as late as the time of the Sixth Dynasty the eldest son of the king was entitled “the royal son of Nekhbit.”

Nekhbit, the vulture, was the goddess of the south, in contradistinction to Uazit, the serpent, the goddess of the north. But in both the south and the north the same dominant race held rule, the same customs prevailed, and the same language was spoken. The Pharaonic Egyptians, in their northern advance, had carried with them a common legacy of ideas and manners. Their religious conceptions had been the same, and consequently the general form assumed by the religious cult was similar. In spite of local differences and the self-centred character of the numerous independent principalities, there was, nevertheless, a family likeness between them all. Ideas and customs, therefore, which grew up in one place passed readily to another, and the influence of a particular local sanctuary was easily carried beyond the limits of the district in which it stood.

One of the most fundamental of the beliefs which the Pharaonic Egyptians brought with them was that in the

---

1 Similarly the “chief Kher-heb” of the Pharaoh, in the age of the Old Empire, bore the title of “Chief of the city of Nekhbit” (Ebers, *Life in Ancient Egypt*, Eng. tr., p. 90). The Pyramid texts speak of the White Crown of Southern Egypt as well as of the royal uraeus “in the city of Nekhbit” (*Pepi* 167); and the goddess of the city is described as “the cow Samet-urt” who was crowned with the two feathers (*Teta* 359). Elsewhere mention is made of “the souls of On, Nekhen, and Pe” (*Pepi* 168, 182; see also *Teta* 272). By the “souls of On” Ra or rather Tum was meant; Pe and Dep constituted the twin-city of the Delta called Buto by the Greeks, over a part of which (Dep) Uazit the serpent-goddess of the north presided, while the other half (Pe) acknowledged Horus as its chief deity. In *Teta* 38 “the doubles in Pe” are said to be “the double of Horus.”
divine origin of certain individuals. The prince who led them was not only the son of a god or goddess, he was an incarnation of the god himself. The belief is one of the many facts which link the Pharaonic civilisation with the culture of primitive Babylonia. In Babylonia also the king was divine. One of the early kings of Ur calls himself the son of a goddess, just as Besh does at Nekhen; and the great conquerors of primeval Asia, Sargon of Akkad and his son Naram-Sin, give themselves the title of "god" in their inscriptions; while Naram-Sin is even invoked during his lifetime as "the god of the city of Agadê" or Akkad. For many generations the Babylonian kings continued to receive divine honours while they were still alive; and it was not until after the conquest of Babylonia by a tribe of half-civilised foreigners from the mountains of Elam that the old tradition was broken, and the reigning king ceased to be a god. Like the doctrine of the divine right of kings in England, which could not survive the fall of the Stuarts, the doctrine of the divine nature of the monarch did not survive in Babylonia the fall of the native dynasties.

In Babylonia also, as in Egypt, the king continued to be invoked as a god after his death. Chapels and priests were consecrated to his memory, and stated sacrifices and offerings made to him. It was not necessary that the deified prince should be the supreme sovereign, it was sufficient if he were the head of a feudal principality. Thus, while Dungi, the supreme sovereign of Babylonia, receives in his inscriptions the title of "god," his vassal Gudea, the high priest and hereditary prince of the city of Lagas, is likewise worshipped as a deity, whose cult lasted for many centuries. Gudea was non-Semitic in race, but most of the Babylonian kings who were thus deified were Semites. It is therefore possible that the
deification of the ruler was of Semitic origin, and only adopted from them by the older Sumerian population, as in the case of Gudea; it is also possible that it was one of the consequences of that fusion of the two races, Sumerian and Semitic, which produced the later population and culture of Babylonia. However this may be, the apotheosis of the Babylonian king during his lifetime can be traced back as far as Sargon and Naram-Sin, 3800 B.C. Sargon incorporated Palestine, "the land of the Amorites," as it was then called, into his empire, while Naram-Sin extended his conquests to Mâgan or the Sinaitic Peninsula, thus bringing the arms and civilisation of Babylonia to the very doors of Egypt. The precise nature of the connection which existed between the Babylonian and the Egyptian belief in the divinity of the ruler must be left to future research.

In the Egyptian mind, at all events, it was a belief that was deeply implanted. The Pharaoh was a god upon earth. Like the Incas of Peru, he belonged to the solar race, and the blood which flowed in his veins was the ichor of the gods. The existence of a similar belief in Peru shows how easy it was for such a belief to grow up in regard to the leader of a conquering people who brought with them a higher culture and the arts of life. But it presupposes religious conceptions which, though characteristic of Babylonia, are directly contrary to those which seem to underlie the religion of Egypt. Among the Babylonians the gods assumed human forms; man had been made in the likeness of the gods, and the gods therefore were of human shape. The converse, however, was the case in Egypt. Here the gods, with few exceptions, were conceived of as brute beasts. Horus was the hawk, Nekhbit the vulture, Uazit of Buto the deadly uraeus snake.

There is only one way of explaining the anomaly,
The conception of the gods which made them men must have come from outside, and been imposed upon a people whose gods were the brute beasts. It must have been the Pharaonic invaders from Asia to whom the leader they followed was an incarnate god. Hence it was just this leader and no other who was clothed with divinity. Hence, too, it was that the older worship of animals was never really harmonised with the worship of the Pharaoh. The inner contradiction which existed between the new religious conceptions remained to the end, in spite of all the efforts of the priestly colleges to make them agree. Religious art might represent the god with the head of a beast or bird and the body of a man, the sacred books might teach that the deity is unconfined by form, and so could pass at will from the body of a man into that of a beast; but all such makeshifts could not hide the actual fact. Between the deity who is human and the deity who is bestial no true reconciliation is possible.

We must therefore trace the deification of the Pharaoh back to Asia, and the Asiatic element in the Egyptian population. The Pharaonic conquerors of the valley of the Nile were those "followers of Horus" who worshipped their leader as a god. It was a god in human form who had led them to victory, and Horus accordingly continued to be represented as a man, even though the symbolism of the hieroglyphs united with the creed of the prehistoric races of Egypt in giving him the head of a hawk.

At first the ruler of each of the small kingdoms into which prehistoric Egypt was divided, was honoured as a god, like Gudea in Babylonia. When the kingdoms became, first, vassal principalities under a paramount lord, and then nomes, the old tradition was still maintained. Divine titles were given to the nomarchs even in the later times of the united monarchy, and after their
death worship continued to be paid to them.\(^1\) Christian writers tell us how at Anabé particular individuals were regarded as gods, to whom offerings were accordingly brought; and Ptah, the tutelary deity of Memphis, was pictured as a man in the wrappings of a mummy, while to Anhur of This the human figure was assigned.

With the coalescence of the smaller principalities into two kingdoms, the deification of the ruler was confined within narrower bounds. But for that very reason it became more absolute and intense. The supreme sovereign, the Pharaoh as we may henceforth call him, was a veritable god on earth. To his subjects he was the source, not only of material benefits, but of spiritual blessings as well. He was "the good god," the beneficent dispenser of all good things.\(^2\) The power of life and death was in his hand, and rebellion against him was rebellion against the gods. The blood that flowed in his veins was the same as that which flowed in the veins of the gods; it was even communicated to him from time to time by his divine brethren; and the bas-reliefs of a later age, when the traditional belief had become little more than a symbolical allegory, still depict him with his back towards the statue of the god, who is transfusing the ichor of heaven through his veins.\(^3\)

Menes, the king of Upper Egypt, first united under one sceptre the two kingdoms of the Nile. The divinity which had hitherto been shared between the Pharaohs of Upper and Lower Egypt now passed in all its fulness to him. He became the visible god of Egypt, just as

---

\(^1\) Wiedemann, in the *Proceedings of the Society of Biblical Archaeology*, iv. p. 332.

\(^2\) The title of "good god" went back to a very early date, and stands in contrast to that of nefer mât-kher, "good and true of voice," applied to the ordinary individual on early seal-cylinders.

\(^3\) See the illustration from the temple of Amon-hotep III. at Luxor, in Maspero, *Dawn of Civilisation*, p. 111.
Sargon or Naram-Sin was the visible god of Akkad. All the attributes of divinity belonged to him, as they were conceived of by his subjects, and from him they passed to his successors. Legitimacy of birth was reckoned through the mother, and through the mother accordingly the divine nature of the Pharaoh was handed on. Only those who had been born of a princess of the royal family could be considered to possess it in all its purity; and where this title was wanting, it was necessary to assume the direct intervention of a god. The mother of Amon-hotep III. was of Asiatic origin; we read, therefore, on the walls of the temple of Luxor, that he was born of a virgin and the god of Thebes. Alexander, the conqueror of Egypt, was a Macedonian; it was needful, accordingly, that he should be acknowledged as a son by the god of the oasis of Ammon.¹

But such consequences of the old Egyptian belief in the incarnation of the deity in man are leading us away into a field of investigation which will have to be traversed in a future lecture. For the present, it is sufficient to keep two facts steadily before the mind: on the one side, the old Egyptian belief in the divinity of the brute beast; on the other, the equally old belief in the divinity of man. The two beliefs are not really to be harmonised one with the other; they were, in fact, derived from different elements in the Egyptian population; but, with his usual conservative instinct and avoidance of abstract thought, the Egyptian of later days co-ordinated them together, and closed his eyes to their actual incompatibility.

¹ The Westcar Papyrus, which was written in the time of the Middle Empire, already describes the first three kings of the Fifth Dynasty as born of Ruddadt (the wife of a priest of the sun-god) and the god Ra of Sakhab (Erman, "Die Märchen des Papyrus Westcar," i. p. 55, in the Mittheilungen aus den orientalischen Sammlungen zu Berlin, 1890).
LECTURE III.

THE IMPERISHABLE PART OF MAN AND THE OTHER WORLD.

It has sometimes been asserted by travellers and ethnologists, that tribes exist who are absolutely without any idea of God. It will usually be found that such assertions mean little more than that they are without any idea of what we mean by God: even the Zulus, who saw in a reed the creator of the world,\(^1\) nevertheless believed that the world had been created by a power outside themselves. Modern research goes to show that no race of man, so far as is known, has been without a belief in a power of the kind, or in a world which is separate from the visible world around us; statements to the contrary generally rest on ignorance or misconception. The very fact that the savage dreams, and gives to his dreams the reality of his waking moments, brings with it a belief in what, for the want of a better term, I will call "another world."

This other world, it must be remembered, is material, as material as the "heavenly Jerusalem" to which so many good Christians have looked forward even in our own day. The savage has no experience of anything else than material existence, and he cannot, therefore, rise to the conception of what we mean by the spiritual, even if he were capable of forming so abstract an idea. His

\(^{1}\) Callaway, Unkulunkulu; or, the Tradition of the Creation as existing among the Amazulu and other Tribes of South Africa, pt. i. pp. 2, 7, 8.
spiritual world is necessarily materialistic, not only to be interpreted and apprehended through sensuous symbols, but identical with those sensuous symbols themselves. The Latin *anima* meant "breath" before it meant "the soul."

This sensuous materialistic conception of the spiritual has lingered long in the human mind; indeed, it is questionable whether, as long as we are human, we shall ever shake ourselves wholly free from it. The greater is naturally its dominance the further we recede in history. There is "another world," but it is a world strangely like our own.

Closely connected with this conception of "another world" is the conception which man forms concerning his own nature. There are few races of mankind among whom we do not find in one shape or another the belief in a second self. Sometimes this second self is in all respects a reflection and image of the living self, like the images of those we see in our dreams; and it is more than probable that dreams first suggested it. Sometimes it is a mere speck of grey vapour, which may owe its origin to the breath which issues from the mouth and seems to forsake it at death, or to the misty forms seen after nightfall by the savage in the gloom of the forest and by the edge of the morass. At times it is conceived of as a sort of luminous gas or a phosphorescent flash of light, such as is emitted by decaying vegetation in a damp soil. Or, again, it may be likened to the bird that flies to heaven, to the butterfly which hovers from flower to flower, or even to insects like the grasshopper which hop along the ground. But however it may be envisaged, it is at once impalpable and material, something that can be perceived by the senses and yet eludes the grasp.

The Egyptian theory of the nature of man in the historical age of the nation was very complicated. Man was made up of many parts, each of which was capable
of living eternally. The belief in his composite character was due to the composite character of the people as described in the last lecture, added to that conservative tendency which prevented them from discarding or even altering any part of the heritage of the past. Some at least of the elements which went "to the making of man" were derived from different elements in the population. They had been absorbed, or rather co-ordinated, in the State religion, with little regard to their mutual compatibility and with little effort to reconcile them. Hence it is somewhat difficult to distinguish them all one from another; indeed, it is a task which no Egyptian theologian even attempted; and when we find the list of them given in full, it is doubtless to secure that no component part of the individual should be omitted, the name of which had been handed down from the generations of old.

There were, however, certain component parts which were clearly defined, and which occupied an important place in the religious ideas of Egypt. Foremost amongst these was the Ka or "Double." Underneath the conception of the Ka lay a crude philosophy of the universe. The Ka corresponded with the shadow in the visible world. Like the shadow which cannot be detached from the object, so, too, the Ka or Double is the reflection of the object as it is conceived of in the mind. But the Egyptian did not realise that it was only a product of the mind. For him it was as real and material as the shadow itself; indeed, it was much more material, for it had an independent existence of its own. It could be separated from the object of which it was the facsimile and presentation, and represent it elsewhere. Nay, more than this, it was what gave life and form to the object of which it was the image; it constituted, in fact, its essence and personality. Hence it was sometimes interchanged with the "Name" which, in the eyes of the Egyptian, was the
essence of the thing itself, without which the thing could not exist. In a sense the Ka was the spiritual reflection of an object, but it was a spiritual reflection which had a concrete form.

The "ideas" of Plato were the last development of the Egyptian doctrine of the Ka. They were the archetypes after which all things have been made, and they are archetypes which are at once abstract and concrete. Modern philosophers have transformed them into the thoughts of God, which realise themselves in concrete shape. But to the ancient Egyptian the concrete side of his conception was alone apparent. That the Ka was a creation of his own mind never once occurred to him. It had a real and substantial existence in the world of gods and men, even though it was not visible to the outward senses. Everything that he knew or thought of had its double, and he never suspected that it was his own act of thought which brought it into being.

It was symbolism again that was to blame. Once more the symbol was confused with that for which it stood, and the abstract was translated into the concrete. The abstract idea of personality became a substantial thing, to which all the attributes of substantial objects were attached. Like the "Name," which was a force with a concrete individuality of its own, the Ka was as much an individual entity as the angels of Christian belief.

Between it and the object or person to which it belonged, there was the same relation as exists between the conception and the word. The one presupposed the other. Until the person was born, his Ka had no existence; while, on the other hand, it was the Ka to which his existence was owed. But once it had come into being the Ka was immortal, like the word which, once formed, can exist independently of the thought which gave
it birth. As soon as it left the body, the body ceased to live, and did not recover life and consciousness until it was reunited with its Ka. But while the body remained thus lifeless and unconscious, the Ka led an independent existence, conscious and alive.

This existence, however, was, in a sense, quite as material as that of the body had been upon earth. The Ka needed to be sustained by food and drink. Hence came the offerings which were made to the dead as well as to the gods, each of whom had his Ka, which, like the human Ka, was dependent on the food that was supplied to it. But it was the Ka of the food and the Ka of the drink upon which the Ka of man or god was necessarily fed. Though at first, therefore, the actual food and drink were furnished by the faithful, the Egyptians were eventually led by the force of logic to hold that models of the food and drink in stone or terra-cotta or wood were as efficacious as the food and drink themselves. Such models were cheaper and more easily procurable, and had, moreover, the advantage of being practically imperishable. Gradually, therefore, they took the place of the meat and bread, the beer and wine, which had once been piled up in the dead man's tomb, and from the time of the Eighteenth Dynasty onwards we find terra-cotta cakes, inscribed with the name and titles of the deceased, substituted for the funerary bread.

The same idea as that which led to the manufacture of these sham offerings had introduced statues and images into the tomb at an early date. In the tombs of the Third and Fourth and following Dynasties, statues have been found of a very high order of art. No effort has been spared to make them speaking likenesses of the men and women in whose tombs they were placed; even the eyes have been made lifelike with inlaid ivory and obsidian. Usually, too, the statues are carved out of the
hardest, and therefore the most enduring, of stone, so that, when the corpse of the dead was shrivelled beyond recognition, his counterpart in stone still represented him just as he was in life. But the statue had its Ka like the man it represented, and if the likeness were exact, the Ka of the statue and the Ka of the man would be one and the same. Hence the Ka could find a fitting form in which to clothe itself whenever it wished to revisit the tomb and there nourish itself on the offerings made to the dead by the piety of his descendants. And even if the mummy perished, the statue would remain for the homeless Ka.¹

It was probably on this account that we so often find more than one statue of the dead man in the same tomb. The more numerous the statues, the greater chance there was that one at least of them would survive down to the day when the Ka should at last be again united to its body and soul. And the priests of Heliopolis discovered yet a further reason for the practice. From time immemorial Ra the sun-god had been invoked there under the form of his seven birdlike "souls" or spirits, and double this number of Kas was now ascribed to him, each corresponding with a quality or attribute which he could bestow upon his worshippers.² Symbols already existed in the hieroglyphics for these various qualities, so that it was easy to regard each of them as having a separate and concrete existence, and so being practically a Ka.

The funerary statue and the ideas connected with it seem to have been characteristic of Memphis and the school of theology which existed there. At all events,

¹ Professor Maspero, to whom, along with Sir P. Le Page Renouf, we owe the explanation of what the Egyptians meant by the Ka, first pointed out the meaning of the portrait statues which were buried in the tomb (Recueil de Travaux, i. pp. 152-160).

² Renouf, TSBA. vi. p. 504 sqq.; Lepsius, Denkmäler, iii. 194. 13; Dümichen, Tempelinschriften, i. pl. 29.
no similar statues have been discovered at Abydos in the
tombs of the first two (Thinite) dynasties; they make
their appearance with the rise of Memphite influence
under the Third Dynasty. And with the disappearance
of the old Memphite empire, they too tend to disappear.
The disturbed condition of Egypt after the fall of the
Sixth Dynasty was not favourable to art, and it was
probably difficult to find artists any longer who could
imitate with even approximate accuracy the features of
the dead.

But under the Theban dynasties another kind of
image becomes prominent. This was the Ushebti or
"Respondent," hundreds of which may be seen in most
museums. They are usually small figures of blue or
green porcelain, with a mattock painted under each arm,
and a basket on the back. The name and titles of the
deceased are generally inscribed upon them, and not
unfrequently the 6th chapter of the Egyptian funerary
ritual or Book of the Dead. The chapter reads as fol-
lows: "O these ushebtis, whatever be the work it is
decreed the Osirified one must do in the other world,
let all hindrances to it there be smitten down for him,
even as he desires! Behold me when ye call! See
that ye work diligently every moment there, sowing the
fields, filling the canals with water, carrying sand from
the West to the East. Behold me when ye call!"

The chapter explained what the ushebti-figures were
intended for. Before the dead man, justified though he
had been by faith in Osiris and his own good deeds,
could be admitted to the full enjoyment of the fields of
paradise, it was necessary that he should show that he
was worthy of them by the performance of some work.
He was therefore called upon to cultivate that portion
of them which had been allotted to him, to till the
ground and water it from the heavenly Nile. Had he
been a peasant while on earth, the task would have been an easy one; had he, on the contrary, belonged to the wealthier classes, or been unaccustomed to agricultural labour, it would have been hard and irksome. Thanks to the doctrine of the Ka, however, means were found for lightening the obligation. The relatives of the dead buried with him a number of *ushebtî*-figures, each of which represented a fellah with mattock and basket, and their Kas, it was believed, would, with the help of the sacred words of the Ritual, assist him in his work. Sometimes, to make assurance doubly sure, the images were broken; thus, as it were, putting an end to their earthly existence, and setting their Kas free.

When once the tomb was closed and the mummy hidden away in the recesses, it was necessary to find a way by which the Ka could enter the abode of the dead, and so eat and drink the food that had been deposited there. For it must be remembered that the Ka from its very nature was subject to the same limitations as the person whom it represented. If there was no door it could not enter. Where it differed from the living person was in its existing in a world in which what are shams and pictures to us were so many concrete realities. Consequently all that was needed in order to allow the Ka free entrance into the tomb was to paint a false door on one of its walls; the Ka could then pass in and out through the Ka of the door, and so rejoin its mummy or its statue when so it wished.

This false door, in front of which the offerings to the dead were originally laid, must go back to a primitive period in Egyptian history. Professor Flinders Petrie has shown that it is presupposed by the so-called Banner name of the Egyptian Pharaohs.¹ Ever since the first days of hieroglyphic decipherment, it has been known

¹ *A Season in Egypt*, 1887, pp. 21, 22.
that besides the name or names given to the Pharaoh at
birth, and commonly borne by him in life, he had
another name not enclosed in a cartouche, but in some-
thing that resembled a banner, and was surmounted by
the hawk of the god Horus. It actually represented,
however, not a banner, but the panel above the false
door of a tomb, and the name written within it was the
name of the Ka of the Pharaoh rather than of the
Pharaoh himself. It was accordingly the name by which
he was known after death, the name inscribed on the
objects buried in his tomb, and also the name under
which he was worshipped whether in this life or in the
next. As the Horus or deified leader who had sub-
jugated the older inhabitants of Egypt and founded the
Pharaonic dynasties, it was right and fitting that he
should be known by the name of his Ka. It was not
so much the Pharaoh that was adored by his subjects,
as the Ka of the Pharaoh, and the Pharaoh was god
because the blood of Horus flowed in his veins.

The earliest monuments of the Pharaohs yet dis-
covered give almost invariably only the Ka-name of the
king. The fact is doubtless due in great measure to
their general character. With few exceptions they con-
sist of tombstones and other sepulchral furniture. But
the objects found in the foundations of the temple of
Nekhen are also examples of the same fact. The fusion
was not yet complete, at all events in the south, between
the Pharaoh as man and the Pharaoh as god; it was
his Ka that was divine, rather than the bodily husk in
which it sojourned for a time.

The Ka accordingly occupies a prominent place in the
names of the Pharaohs of the Old Empire, while the
sacred art of the temples continued the ancient tradition
down to the latest times. Horus and the Nile-gods, for
instance, present the Ka of Amon-hotep III. along with
the infant prince to the god of Thebes; and at Soleb the same Pharaoh is represented as making offerings to his own double. Indeed, it is not unfrequent to find the king and his Ka thus separated from one another and set side by side; and at times the Ka becomes a mere symbol, planted like a standard at the monarch's back.

It was the Ka, therefore, which in the early days of Egyptian religious thought was more especially associated with the divine nature of the king. The association of ideas was assisted by the fact that the gods, like men, had each his individual Ka. And in the older period of Egyptian history the Ka of the god and not the god himself was primarily the object of worship. The sacred name of Memphis was Ha-ka-Ptah, "the temple of the Ka of Ptah," which appears as Khikuptahh in the Tel el-Amarna letters, and from which the Greeks derived their Ägyptos, "Egypt." Even in the last centuries of Egyptian independence the prayers addressed to the bull-god Apis are still made for the most part to his Ka.

The Ka, in fact, was conceived of as the living principle which inspired both gods and men. Its separation from the body meant what we call death, and life could return only when the two were reunited. That reunion could take place only in the other world, after long years had passed and strange experiences had been undergone by the disembodied Ka. The 105th chapter of the Book of the Dead contains the words with which on the day of resurrection the Ka was to be greeted. "Hail," says the dead man, "to thee who wast my Ka during life! Behold, I come unto thee, I arise resplendent, I labour, I

1 Cf. the illustrations in Maspero, Dawn of Civilisation, p. 259; and Lepsius, Denkmäler, iii. 87. In Bonomi and Arnundale, Gallery of Antiquities, pt. i. pl. 31, is a picture of Thothmes II. with his Ka standing behind him.
am strong, I am hale, I bring grains of incense, I am purified thereby, and I thereby purify that which goeth forth from thee." Then follow the magical words by which all evil was to be warded off: "I am that amulet of green felspar, the necklace of the god Ra, which is given unto them that are on the horizon. They flourish, I flourish, my Ka flourish even as they, my duration of life flourish even as they, my Ka has abundance of food even as they. The scale of the balance rises, Truth rises high unto the nose of the god Ra on the day on which my Ka is where I am (?). My head and my arm are restored to me where I am (?). I am he whose eye seeth, whose ears hear; I am not a beast of sacrifice. The sacrificial formulae for the higher ones of heaven are recited where I am."

As might be expected, the Ka is often represented with the symbol of life in its hands. At the same time, it is important to remember that, though under one aspect the Ka was identical with the principle of life, in the mind of the Egyptian it was separate from the latter, just as it was separate from consciousness and from the divine essence. These were each of them independent entities which were possessed by the Ka just as they were possessed by its human counterpart. Life, consciousness, and relationship to the gods were all attributes of the Ka, but they were attributes, each of which had a concrete and independent existence of its own.

At the outset, doubtless, the Ka was practically identical with the vital principle. Primitive man does not distinguish as we do between the animate and the inanimate. He projects his own personality into the things he sees about him, and ascribes to them the same motive forces as those which move himself. He knows of only one source of movement and activity, and that source is life. The stars which travel through the
firmament, the arrow that flies through the air, are either alive or else are directed and animated by some living power. Movement, in fact, implies life, and the moving object, whatever it may be, is a living thing.

The old belief or instinct is still strong in the child. He revenges himself upon the ball or stone that has struck him as though it too were a living being. In the Mosaic law it is laid down that "if an ox gore a man or a woman that they die, then the ox shall be surely stoned"; and similar penalties were enforced against animals which had injured man, not only in the Middle Ages, but even in the eighteenth century. Thus a pig was burned at Fontenay-aux-Roses, in 1266, for having devoured a child; and in 1389 a horse was brought to trial at Dijon for the murder of a man, and condemned to death. In Brazil, in 1713, an action was brought against the ants who had burrowed under the foundations of a monastery, and, after counsel had been heard on both sides, they were solemnly condemned to banishment by the judge; while, in 1685, the bell of the Protestant chapel at La Rochelle was first scourged for having abetted heresy, then catechised and made to recant, and finally baptized.¹

The early Egyptians were not more enlightened than the orthodox theologians of La Rochelle. For them, too, action must have implied life, and the distinction between object and subject had not yet been realised. Hence the belief that objects as well as persons had each its Ka, a belief which was strengthened by the fact that they all alike cast shadows before them, as well as the further belief that the nature of the Ka was in either case the same. Hence it was, moreover, that the ushebti-figures and other sepulchral furniture were broken in order that their Kas might be released from them, and so accompany

the Ka of the dead man in his wanderings in the other world. As life and the power of movement deserted the corpse of the dead man as soon as his Ka was separated from it, so too the Ka of the ushebti passed out of it when its form was mutilated by breakage. The life that was in it had departed, as it were, into another world.

It is even possible that the very word Ka had originally a connection with a root signifying "to live." At any rate, it was identical in spelling with a word which denoted "food"; and that the pronunciation of the two words was the same, may be gathered from the fact that the Egyptian bas-reliefs sometimes represent the offerings of food made to the dead or to the gods inside the arms of the symbol of the Ka.1 When we remember that vivande is nothing more than the Latin vivenda, "the things on which we live," there arises at least the possibility of an etymological connection between the double and the principle of life which it once symbolised.2

Now, in my Hibbert Lectures on the Religion of the Ancient Babylonians, I pointed out that the early Sumerian inhabitants of Babylonia held a belief which is almost precisely the same as that of the Egyptians in regard to the Ka. In Babylonia also, everything had its Zi or "double," and the nature of this Zi is in no way distinguishable from that of the Egyptian Ka. As in Egypt, moreover, the gods had each his Zi as well as men and things, and, as in Egypt, it was the Zi of the god rather than the god himself which was primarily worshipped. So marked is the resemblance between the

---

1 It is noticeable that while the Tel el-Amarna letters show that the actual pronunciation of the word Ka was Ku, Ha-ka-Ptah, the sacred name of Memphis, being written Khi-ku-Ptakh (Aiguptos), ku was "food" in the Sumerian of primitive Babylonia.

2 In his Études de Mythologie et d'Archéologie égyptiennes, i. p. 61, Professor Maspero gives "cake" as the original sense of Ka, which, however, he explains as "a cake of earth," and hence "substance."
two conceptions, that in working it out on the Babylonian side, I could not resist the conviction that there must have been some connection between them. That was sixteen years ago. Since then discoveries have been made and facts brought to light which indicate that a connection really did exist between the Babylonia and the Egypt of the so-called prehistoric age, and have led me to believe, with Hommel, de Morgan, and others, that Babylonia was the home and cradle of the Pharaonic Egyptians. In Sumerian the word Zi signified "life," and was denoted by the picture of a flowering reed. It was the life on which was imprinted the form of the body that was for a time its home, and its separation from the body meant the death of the latter. The Sumerians never advanced to the further stage of making the vital principle itself a separable quality; perhaps the original signification of the word which it never lost would have prevented this. But they did go on to transform the Zi into a spirit or demon, who, in place of being the counterpart of some individual person or thing, could enter at will into any object he chose. Even in Egypt, traces of the same logical progress in ideas may perhaps be found. If Professor Maspero is right in his interpretation of certain passages in the Pyramid texts and Ptolemaic papyri, "The double did not allow its family to forget it, but used all the means at its disposal to remind them of its existence. It entered their houses and their bodies, terrified them, waking and sleeping, by its sudden apparitions, struck them down with disease or madness, and would even suck their blood like the modern vampire." ¹ Such a

¹ Maspero, *Dawn of Civilisation*, p. 114. The Ka, however, is here identified with the Khu, and it is questionable whether the passages referred to in the Pyramid texts really embody old ideas which are to be interpreted literally, or whether they are not rather to be taken metaphorically.
conception of the Ka, however, if ever it existed, must have soon passed away, leaving behind it but few vestiges of itself.

I have dwelt thus long on the doctrine of the Ka or double on account both of its importance and of the difficulties it presents to the modern scholar. Its discovery by Professor Maspero and Sir P. Le Page Renouf cleared away a host of misconceptions, and introduced light into one of the darkest corners of Egyptian religion.\(^1\) And however strange it may seem to us, it was in thorough accordance with the simple logic of primitive man. Given the premisses, the conclusion followed. It was only when the Egyptian came to progress in knowledge and culture, and new ideas about his own nature were adopted, that difficulties began to multiply and the theory of the Ka to become complicated.

Among these new ideas was that of the Khu or "luminous" part of man. On the recently discovered monuments of the early period, the Khu holds a place which it lost after the rise of Memphite influence with the Third Dynasty. We find it depicted on the tombstones of Abydos embraced by the down-bent arms of the Ka. The Khu, therefore, was conceived of as comprehended in the human Ka, as forming part of it, though at the same time as a separate entity. It was, in fact, the soul of the human Ka, and was accordingly symbolised by the crested ibis.\(^2\) It may be that it was in the beginning nothing more than the phosphorescent light emitted by decaying vegetation which the belated

---

\(^2\) This particular bird was chosen because its name was similar in sound to that of the Khu. For the same reason the plover (\(\text{ba}\)) denoted the Ba or soul. On objects found by de Morgan in the tomb of Aha at Negada, the "soul" is represented by an ostrich.
wayfarer took for a ghost; the *ginn* (*jinn*) of the modern Egyptian fellah are similar lights which flash up suddenly from the ground. But the earliest examples of its use on the monuments are against such an ignoble origin, and suggest rather that it was the glorified spirit which mounted up like a bird in the arms of its Ka towards the brilliant vault of heaven. It is not until we come to the decadent days of the Greek and Roman periods that the Khu appears in a degraded form as a malignant ghost which enters the bodies of the living in order to torment them. No traces of such a belief are to be found in older days. The Pyramid texts speak of "the four Khu of Horus," "who live in Heliopolis," and were at once male and female, and of the Khu who brandish their arms and form a sort of bodyguard around the god of the dead. They are identified with the fixed stars, and more especially with those of the Great Bear, and in the euhemeristic chronicles of Egyptian history they become the "Manes" of Manetho, the semi-divine dynasty which intervened between the dynasties of the gods and of men.\(^1\)

The Khu thus forms a link between men and the gods, and participates in the divine nature. It is the soul regarded as a godlike essence, as coming down from heaven rather than as mounting up towards it. It is not only disembodied, but needs the body no longer; it belongs to the Ka, which still lives and moves, and not to the mummified corpse from which the vital spark has fled. It waits on the god of the dead, not on the dead themselves.

It seems probable, therefore, that in the part of Egypt in which the doctrine of the Khu grew up, mummification was not practised; and the probability is strengthened by the fact that, before the rise of the Third Dynasty,

embalming was apparently not frequent in Upper Egypt, even in the case of the kings. But, however this may be, one thing is certain. The conception of the Khu cannot have originated in the same part of the country, or perhaps among the same element in the population, as a parallel but wholly inconsistent conception which eventually gained the predominance. According to this conception, the imperishable part of man which, like the Ka, passed after death into the other world, was the Ba or "soul." Like the Khu, the Ba was pictured as a bird; but the bird is usually given a human head and sometimes human hands. But, while the Khu was essentially divine, the Ba was essentially human. It is true that the Ba, as well as the Khu, was assigned to the gods—Ra of Heliopolis was even credited with seven; but whereas man possessed a Khu or luminous soul because he was likened to the gods, the gods possessed a Ba because they were likened to men.

The relation between the two is brought out very clearly in the philosophy of the so-called Hermetic books, which endeavoured to translate the theology of Egypt into Greek thought. There we are told that the Khu is the intelligence (νοῦς), of which the Ba or soul (ψυχή) is as it were the envelope. As long as the soul is imprisoned in the earthly tabernacle of the body, the intelligence is deprived of the robe of fire in which it should be clothed, its brightness is dimmed, and its purity is sullied. The death of the body releases it from its prison-house; it once more soars to heaven and becomes a spirit (δαίμων), while the soul is carried to the hall of judgment, there to be awarded punishment.

1 From the fifteenth to the eleventh century B.C., it was fashionable to substitute for the bird a beetle with a ram’s head, the phonetic value of the hieroglyph of ram being ba, and that of the beetle kheper, “to become.”
or happiness in accordance with its deserts.\(^1\) The Khu, in other words, is a spark of that divine intelligence which pervades the world and to which it must return; the Ba is the individual soul which has to answer after death for the deeds committed in the body.

The plover was the bird usually chosen to represent the Ba, but at times the place of the plover is taken by the hawk, the symbol of Horus and the solar gods. That the soul should have been likened to a bird is natural, and we meet with the same or similar symbolism among other peoples. Like the bird, it flew between earth and heaven, untrammelled by the body to which it had once been joined. From time to time it visited its mummy; at other times it dwelt with the gods above. Now and again, so the inscriptions tell us, it alighted on the boughs of the garden it had made for itself in life, cooling itself under the sycamores and eating their fruits. For the Ba was no more immaterial than the Ka; it, too, needed meat and drink for its sustenance, and looked to its relatives and descendants to furnish them.

But, as Professor Maspero\(^2\) has pointed out, there was a very real and fundamental difference between the idea of the Ka or double, and that of the Ba or soul. The Ka was originally nourished on the actual offerings that were placed in the tomb of the dead man; it passed into it through the false door and consumed the food that it found there. But the soul had ascended to the gods in heaven; it lived in the light of day, not in the darkness of the tomb; and it is doubtful if it was ever supposed to return there. To the gods accordingly was committed the care of the Ba, and of seeing that it was properly provided for. By the power of prayer and

\(^1\) Hermes Trismeg., *Pæmandres*, ed. Parthey, chs. i. and x.
\(^2\) *Études de Mythologie*, i. p. 166.
magical incantation, the various articles of food, or, more strictly speaking, their doubles, were identified with the gods, and communicated by the gods to the soul. Long before the days when the Pyramid texts had been compiled, this theory of the nourishment of the soul was applied also to the nourishment of the Ka, and the older belief in the material eating and drinking of the Ka had passed away. All that remained of it was the habitual offering of the food to the dead, a custom which still lingers among the fellahin of Egypt, both Moslem and Copt.

Besides the double and the two souls, there was yet another immortal element in the human frame. This was the heart, the seat both of the feelings and of the mind. But it was not the material heart, but its immaterial double, which passed after death into the other world. The material heart was carefully removed from the mummy, and with the rest of the intestines was usually cast into the Nile. Porphyry ¹ tells us that in his time, when the bodies of the wealthier classes were embalmed, the Egyptians "take out the stomach and put it into a coffer, and, holding the coffer to the sun, protest, one of the embalmers making a speech on behalf of the dead. This speech, which Euphantos translated from his native language, is as follows: 'O Lord the Sun, and all ye gods who give life to man, receive me and make me a companion of the eternal gods. For the gods, whom my parents made known to me, as long as I have lived in this world I have continued to reverence, and those who gave birth to my body I have ever honoured. And as for other men, I have neither slain any, nor defrauded any of anything entrusted to me, nor committed any other wicked act; but if by chance I have committed any sin in my life, ¹ De Abst. iv. 10.
by either eating or drinking what was forbidden, not of
myself did I sin, but owing to these members,'—at the
same time showing the coffer in which the stomach was.
And having said this, he throws it into the river, and
embalms the rest of the body as being pure. Thus they
thought that they needed to excuse themselves to God
for what they had eaten and drunken, and therefore so
reproach the stomach.”

Now and then, however, the heart and intestines
were replaced in the mummy, but under the protection
of wax images of the four genii of the dead—the four
Khu of the Book of the Dead. More often they were
put into four vases of alabaster or some other material,
which were buried with the dead. Though the latter
practice was not very common, probably on account of
its expense, it must go back to the very beginnings of
Egyptian history. The hieroglyphic symbol of the heart
is just one of these vases, and one of the two names
applied to the heart was ḫati, “that which belongs to
the vase.” After ages even endeavoured to draw a
distinction between ab “the heart” proper, and ḫati “the
heart-sack.”

From the time of the Twelfth Dynasty onwards, the
place of the material heart in the mummy was taken
by an amulet, through the influence of which, it was
supposed, the corpse would be secured against all the
dangers and inconveniences attending the loss of its

1 Cf. also Plutarch, De Esu carnium Or. ii. p. 996, and Sept. Sapient.
Conviv. p. 159 B.
2 The four vases were dedicated to the man-headed Amset (or Smet), the
jackal-headed Dua-mut-ef, the ape-headed Hâpi, and the hawk-headed
Qebh-sonu-f, who are identified with the planets in the Pyramid texts
3 See the Book of the Dead, chs. xxvi. and sqq.
4 It is still a moot question whether any scarabs go back to the age of
the Old Empire. Personally, I can no longer agree with Prof. Flinders
Petrie in thinking that they do so.
heart until the day of resurrection. The amulet was in
the form of a beetle or scarab, the emblem of "becoming"
or transformation, and on the under side of it there was
often inscribed the 30th chapter of the Book of the
Dead, to the words of which were ascribed a magical
effect. The chapter reads as follows: "O heart (ab) of
my mother, O heart (hati) of my transformations! Let
there be no stoppage to me as regards evidence (before
the judges of the dead), no hindrance to me on the part
of the Powers, no repulse of me in the presence of the
guardian of the scales! Thou art my Ka in my body,
the god Khnum who makes strong my limbs. Come
thou to the good place to which we are going. Let not
our name be overthrown by the lords of Hades who
cause men to stand upright! Good unto us, yea good is
it to hear that the heart is large (and heavy) when the
words (of life) are weighed! ¹ Let no lies be uttered
against me before God. How great art thou!"

Meanwhile the immaterial heart, the "Ka" of it,
which is addressed in the words just quoted, had made
its way through the region of the other world, until it
finally reached the place known as "the Abode of
Hearts." Here in the judgment-hall of Osiris it met the
dead man to whom it had formerly belonged, and here,
too, it accused him of all the evil words and thoughts he
had harboured in his lifetime, or testified to the good
thoughts and words of which he had been the author.
For the heart, though the organ through which his
thoughts and words had acted, was not the cause of
them; in its nature it was essentially pure and divine,
and it had been an unwilling witness of the sins it had
been forced to know. Eventually it was weighed in the
balance against the image of Truth, and only if the

¹ Or, according to Renouf's translation: "Pleasant unto us, pleasant
unto the listener, is the joy of the weighing of the words."
scales turned in favour of the dead man could it rejoin its former body and live with it for ever in the islands of the Blest.

The scales and judgment-hall, however, belong to the religious conceptions which gathered round the name of Osiris, like the Paradise which the risen mummy looked forward to enjoy. It was only after the worship of Osiris had become universal throughout Egypt, and the older or local ideas of the future life had been accommodated to them, that it was possible for an Egyptian to speak of meeting his disembodied heart, or of the testimony it could give for or against him before the judges of the dead. The fact that the use of the scarab does not seem to extend further back than the age of the Memphite or Theban dynasties, may imply that it was only then that the Osirian beliefs were officially fitted on to earlier forms of faith. However this may be, the worship of Osiris and the beliefs attaching to it must be left to another lecture, and for the present we must pass on to the mummy itself, the last part of man which it was hoped would be immortal.

The mummy or Sāhu has to be carefully distinguished from the Khat or natural body. The latter was a mere dead shell, seen by the soul but not affording a resting-place for it. The mummy, on the other hand, contained within itself the seeds of growth and resurrection. It could be visited by the soul and inspired by it for a few moments with life, and the Egyptian looked forward to a time when it would once more be reunited with both its heart and its soul, and so rise again from the dead.

It is impossible to say how far back in the history of the Egyptian religion this belief in the immortality of the mummy may go. It can hardly have originated in the same circle of ideas as the doctrine of the Ka, though the doctrine of the Ka could easily be reconciled
with it. On the one hand, it seems connected, as we shall see, with the cult of Osiris; but, on the other hand, there are no traces of mummification in the prehistoric graves, and it is doubtful whether there are any in the royal tombs of Negada and Abydos which belong to the age of the First and Second Dynasties. At all events, the scarab, which accompanied embalmment, first appears at a much later date, and perhaps had a Memphite origin. There are, however, indications that the process of embalming first arose among the pre-Menic rulers of Nekhen, in the neighbourhood of El-Kab. The soil of El-Kab literally effloresces with the natron, which, it was discovered, preserved the bodies buried in it; and even as late as the time of the Pyramid texts of the Fifth and Sixth Dynasties, when the northern sources of natron were known, it was still necessary for ceremonial purposes that the materials used by the embalmer should contain some of the natron of El-Kab.  

What was difficult to harmonise with the belief in the resurrection of the mummy was the belief which made the risen man an "Osiris," identified, that is to say, in substance with the god Osiris, and not his old material self. In the days, therefore, when Greek philosophy took it in hand to systematise and interpret the theology of Egypt, the risen mummy drops out of sight. The Khu, as we have seen, becomes the divine intelligence, which for a time is enshrouded in the human soul; and this again needs the envelope of the spirit, which sends the breath of life through the veins before it can tabernacle in the body of man. The Hermetic books tell us

---

1 Three grains of the natron of the city of Nekhbit had to be used, while only two grains of that of the north were required (Maspero, "Pyramide du roi Ounas" in the Recueil de Travaux, iii. p. 182). The Horus of Nekhen, opposite El-Kab, was represented by a mummified hawk (akhem).
that while body, spirit, and soul are common to man and the beasts, the divine intelligence is his alone to possess, stripped, indeed, of its native covering of ethereal fire, but still the veritable spirit of God. Ever is it seeking to raise the human soul to itself, and so purify it from the passions and desires with which it is inspired by the body. But the flesh wages continual war against it, and endeavours to drag the soul down to its own level. If the soul yields, after death the intelligence returns to its original state, while the soul is arraigned before the judgment-seat of heaven, and there being accused by its conscience, the heart, is condemned to the punishment of the lost. First it is scourged for its sins, and then handed over to the buffetings of the tempests, suspended between earth and sky. At times in the form of an evil demon it seeks alleviation of its torments by entering the body of a man or animal, whom it drives to murder and madness. But at last, after ages of suffering, the end comes; it dies the second death, and is annihilated for ever.

The good soul, on the other hand, which has listened in life to the voice of the divine intelligence, and struggled to overcome the lusts and passions of the flesh, obtains after death its reward. Guided by the intelligence, it traverses space, learning the secrets of the universe, and coming to understand the things that are dark and mysterious to us here. At length its education in the other world is completed, and it is permitted to see God face to face and to lose itself in His ineffable glory.

I need not point out to you how deeply this Hellenised philosophy of Egypt has affected the religious thought of Christian Alexandria, and through Alexandria of Christian Europe. It may be that traces of it may be detected even in the New Testament. At any rate,
much of the psychology of Christian theologians is clearly derived from it. We are still under the influence of ideas whose first home was in Egypt, and whose development has been the work of long ages of time. True or false, they are part of the heritage bequeathed to us by the past.
LECTURE IV.

THE SUN-GOD AND THE ENNEAD.

In my last lecture, when speaking of the form under which the soul of man was pictured by the Egyptians, I mentioned that it was often represented by a hawk, the symbol of the sun-god. Why the hawk should have thus symbolised the sun is a question that has often been asked. The Egyptians did not know themselves; and Porphyry, in the dying days of the old Egyptian faith, gravely declares that it was because the hawk was a compound of blood and breath! One explanation has been that it was because the hawk pounces down from the sky like the rays of the sun, which, like the eagle, he can gaze at without blinking; and a passage in the Odyssey of Homer (xv. 525) has been invoked in favour of this view, where the hawk is called "the swift messenger of Apollo." But if there is any connection between the Homeric passage and the Egyptian symbol, it would show only that the symbol had been borrowed by the Greek poet. Originally, moreover, it was only the sun-god of Upper Egypt who was represented even by the Egyptians under the form of a hawk.

This was Horus, often called in the later texts "Horus the elder" (Hor-ur, the Greek Aroëris), in order to distinguish him from a wholly different god, Horus the younger, the son of Isis. His symbol, the hawk, is found on the early Pharaonic monuments which recent excavations have brought to light. Sometimes the hawk stands
on the so-called standard, which is really a perch, sometimes on the crenelated circle, which denoted a city in those primitive days. The standard is borne before the Pharaoh, representing at once his own title and the nome or principality over which he held rule; and its resemblance to the stone birds perched on similar supports, which Mr. Bent found in the ruins of Zimbabwe, suggests a connection between the prehistoric gold miners of Central Africa and the early inhabitants of Southern Egypt. On one of the early Egyptian monuments discovered at Abydos, two hawks stand above the wall of a city which seems to bear the name of "the city of the kings,"\(^1\) and a slate plaque found by Mr. Quibell at Kom el-Ahmar shows us on one side the Pharaoh of Nekhen inspecting the decapitated bodies of his enemies with two hawks on standards carried before him, while, on the other side, a hawk leads the briddled "North" to him under the guise of a prisoner, through whose lips a ring has been passed.\(^2\) In the first case, the hawks may represent the districts of which the god they symbolised was the protecting deity;\(^3\) in the second case, the god and the king must be identified together. It was as Horus, the hawk, that the Pharaoh had conquered the Egyptians of the north, and it was Horus, therefore, who had given them into his hand.

If Dr. Naville is right, Horus the hawk-god is again represented on the same plaque, with the symbol of "follower," above a boat which is engraved over the bodies of the decapitated slain.\(^4\) Countenance is given

---

\(^{1}\) De Morgan, *Recherches sur les Origines de l'Égypte*, ii. pl. iii. line 2.

\(^{3}\) Professor Maspero, however, proposes to see in them a symbol of the king of Upper Egypt destroying a hostile city.

\(^{4}\) *Recueil de Travaux*, xxi. pp. 116, 117. Dr. Naville points out that on the Palermo Stela the festival of the Shesh-Hor, with the determinative
to this view by a drawing on the rocks near El-Kab, in which the cartouches of two kings of the Fourth Dynasty, Sharu and Khufu, are carried in boats on the prows of which a hawk is perched, while above each name are two other hawks, standing on the hieroglyph of “gold,” and with the crowns of Upper and Lower Egypt on their heads. The title “follower of Horus” would take us back to the earliest traditions of Egyptian history. The “followers of Horus,” according to the later texts, were the predecessors of Menes and the First Dynasty of united Egypt, the Pharaohs and princes of the southern kingdom whose very names were forgotten in after days. Nevertheless, it was remembered that they had founded the great sanctuaries of the country; thus an inscription at Dendera declares that in the reign of king Pepi of the Sixth Dynasty there was found in the wall of the palace a parchment on which was a plan of the temple drawn upon it in the time of “the followers of Horus.” The legends of Edfu told how these followers of Horus had been smiths, armed with weapons of iron, and how they had driven the enemies of their leader before them until they had possessed themselves of the whole of Egypt.

of a sacred bark, occurs repeatedly in that part of the inscription which relates to the festivals of the kings of the first two dynasties. Professor Petrie has found the same festival mentioned on two ivory tablets from the tomb of a king of the First Dynasty at Abydos (Petrie, The Royal Tombs of the First Dynasty, pt. i. pl. xvii.); and it may be added that in the Pyramid texts (Pepi 670; Recueil de Travaux, viii. p. 105) the Mâêt or Mâdit bark of the sun-god is identified with the bark of the Shesh-Hor, while the Semkett or bark in which the sun-god voyages at night becomes a bark in which the place of the hawk is taken by a picture of the ben or tomb of Osiris—here identified with that of Akhem the mummified hawk, which forms part of the symbol for the Thinite nome. Elsewhere it is the Semkett or day-bark of the sun which is identified with the festival of the Shesh-Hor (Recueil de Travaux, iii. p. 205).

1 On the mesnîtû or “blacksmiths” of Horus, see Maspero, Études de Mythologie, ii. p. 313 and sqq. The Mesnit or “Forge” was the name given to the passage opening into the shrine of the temple of Edfu.
But many hard-fought battles were needed before this could be accomplished. Again and again had the foe been crushed—at Zadmit near Thebes, at Neter-Khadu near Dendera, at Minia, at Behnesa and Ahnas on the frontier of the Fayyûm, and finally at Zaru on the Asiatic borders of the Delta. Even here, however, the struggle was not over. Horus and his followers had to take ship and pursue the enemy down the Red Sea, inflicting a final blow upon them near Berenice, from whence he returned across the desert in triumph to Edfu.

In this legend, which in its present form is not older than the Ptolemaic period, echoes of the gradual conquest of Egypt by the first followers of the Pharaohs have probably been preserved, though they have been combined with a wholly different cycle of myths relating to the eternal struggle between Horus the son of Isis and his twin brother Set. But the confusion between the two Horuses must have arisen at an early time. Already a king of the Third Dynasty, whose remains have been found in the ruins of Nekhen, and who bore the title of him "who is glorified with the two sceptres, in whom the two Horus gods are united," has above his name the crowned emblems of Horus and Set. The titles of the queens of the Memphite dynasties make it clear that by the two Horuses are meant the two kingdoms of Upper and Lower Egypt, and we must therefore see in Horus and Set the symbols of the South and North.

In the rock drawing, south of El-Kab, to which I have alluded a few minutes ago, the two Horus hawks stand on the symbol of "gold," the one wearing the crown of Southern Egypt, the other that of the North. The "Golden Horus" was, in fact, one of the titles assumed

---

by the Pharaoh at an early date. Whether the epithet applied to the god represented originally the golden colour of the wings of the sparrow-hawk, or whether, as is more probable, it denoted the Horus-hawk of gold who watched over the destinies of the kings of Upper Egypt in their ancient capital of Nekhen, it is now impossible to say.¹ Later ages explained it as referring to the golden rays of the morning sun.

In the time of the Fourth Dynasty the title was attached indifferently to the Ka or death name given to the Pharaoh after his death, and to the living name given to him at his birth into this world. The Horus-hawk, without the symbol of "gold," surmounted, so far as we know, only the Ka name. It was the double of the Pharaoh, rather than the Pharaoh himself, in whom the god had been incarnated. Horus brings the captive northener to the king, and presides over his kingdom; but it is only over the royal Ka that he actually watches.

At Nekhen, the Horus-hawk, to whom the city was dedicated, was represented under the form of a mummy. It was here, perhaps, that the natron of El-Kab was first employed to preserve the dead body from decay, and that Horus was supposed to be entombed, like Osiris at Abydos. At any rate, there is clearly a connection between the dead and mummified Horus and the Horus who stands above the name of the Pharaoh's double. It is probable, therefore, that the identification of Horus with the kings of Upper Egypt originated at Nekhen. The Horus-hawk was the token under which they fought and ruled; it was Horus who had led them to victory,

¹ Mr. Quibell found a large bronze hawk with a head of solid gold and eyes of obsidian along with two bronze figures of Pepi, in the foundation of the temple of Nekhen (Kom el-Ahmar); see Quibell, *Hierakonpolis*, pt. i. pl. xlii. Hor-nubi, "the golden Horus," was the god of the Antæopolitan nome.
and in whose name the Pharaonic Egyptians, with their weapons of metal, overcame the neolithic population of the Nile

That Horus, accordingly, in one shape or another, should have become the patron god of so many principalities in Southern Egypt, is in no way astonishing. He represented the Pharaonic Egyptians; and as they moved northward, subduing the older inhabitants of the country, they carried his worship with them. At Heliopolis he was adored as Hor-em-Khuti or Harmakhis, “Horus issuing from the two horizons,” and identified with Ra, the sun-god, the patron of the city. His image may still be seen in the sphinx of Giza, with its human head and lion’s body. At Edfu, where the Pharaonic invaders appear to have first established themselves, he was worshipped as Hor-behudet under the form of a winged solar disc, a combination of the orb of the sun with the wings of the hawk. A legend inscribed on the walls of the temple, which is a curious mixture of folklore and false etymologising, worked up after the fashion of Lemprière by the priests of the Ptolemaic period,

1 The 1st (Ombite) and 2nd (Apollinopolite) nomes, the 3rd nome (originally) with its capital Nekhen, the nomes of the “Eastern and Western Horus” (Tuphium and Asphynis), Qus “the city of Horus the elder,” the 5th (Coptite) nome, the 6th nome of Dendera in so far as Hathor was daughter and husband of Horus, the 10th (Antæopolite) and 12th (Hierakopolite) nomes, and finally the 15th, 18th, and 20th (Herakleopolite) nomes. In the Delta also Horus was god of the 3rd, 5th, 7th, 8th, 11th, 19th, 25th, 27th, and 30th nomes, of which the 7th and 8th were close to the Asiatic frontier.

2 When this emblem was first invented we do not know; it probably goes back to the præ-Menic period, like the composite animals on the early monuments of Nekhen and Abydos. Its first dateable occurrence is on a boulder of granite in the island of Elephantine above the name and figure of Unas of the Fifth Dynasty. It is also engraved above the double figure of an Old Empire king on a great isolated rock near El-Kab, which is probably of the same date. The tablet on which it is engraved faces south-east.
knows exactly when it was that this emblem of the god came into existence. It was in the three hundred and sixty-third year of the reign of Ra-Harmakhis on earth, when he fled from the rebels who had risen against him in Nubia and had landed at Edfu. Here Horbehudet, the local deity, paid homage to his suzerain and undertook to destroy his enemies. But first, he flew up to the sun "as a great winged disc," in order that he might discover where they were. Then in his new form he returned to the boat of Harmakhis, and there Thoth addressed Ra, saying: "O lord of the gods, the god of Edfu (Behudet) came in the shape of a great winged disc: from henceforth he shall be called Horbehudet." It was after this that Horus of Edfu and his followers, "the smiths," smote the foe from the southern to the northern border of Egypt.

The legend, or rather the prosaic fiction in which it has been embodied, has been composed when the original character of Horus had long been forgotten, and when the sun-god of Heliopolis had become the dominant god of Egypt. It belongs to the age of theological syncretism, when the gods of Egypt were resolved one into the other like the colours in a kaleidoscope, and made intangible and ever-shifting forms of Ra. But it bears witness to one fact,—the antiquity of the worship of Horus of Edfu and of the emblem which was associated with him. The winged solar disc forms part of his earliest history.

The fact is difficult to reconcile with the view of Professor Maspero, that Horus was originally the sky, and is in favour of the general belief of Egyptologists, that he was from the outset the sun-god. Such, at all events, was the opinion of the Egyptians themselves in the later period of their history. In the Pyramid texts Horus already appears as a solar deity, and it is only as the sun-god that his identification with the Pharaohs can
be explained. It was not the sky but the sun who watched over the names of their doubles. It is true that the two eyes of Horus were said to be the sun and the moon, and that a punning etymology, which connected his name with the word her or "face," caused him to be depicted as the face of the sky, the four locks of hair of which were the four cardinal points. But the etymology is late, and there is no more difficulty in understanding how the solar and lunar discs can be called the eyes of the sun-god, than there is in understanding how the winged disc was distinguished from him, or how even in modern phrase the "eye" may be used as a synonym of the whole man. When we speak of "the eye of God," we mean God Himself.  

There is, however, one newly-discovered monument which may be claimed in support of Professor Maspero's theory. Above the Horus-hawk which surmounts the name of the Third Dynasty king found at Nekhen, is the hieroglyph of the sky. But the explanation of this is not difficult to find. On the one hand, the hieroglyph embraces the hawk as the sky does the sun; on the other hand, it gives the pronunciation of the name of Horus, the sky in Egyptian being her or hor, "the high" and uplifted. And the name of Hor-em-Khuti or Harmakhis, "the Horus who issues from the two horizons," must be quite as old as the monument of Nekhen. What the two horizons were is shown us by the hieroglyph which depicts them. They were the twin mountains between which the sun came forth at dawn, and between which he again passes at sunset.

1 Hor-merti, "Horus of the two eyes," was worshipped at Shedennu in the Pharbaethite nome of the Delta. Grébant's view, that the two eyes originally represented the light, seems to me too abstract a conception for an early period (Recueil de Travaux, pp. 72-87, 112-131). In the Pyramid texts (Rec. iv. p. 42), mention is made of Horus with "the blue eyes."
The hieroglyph belongs to the very beginning of Pharaonic Egyptian history. It may have been brought by the Pharaonic immigrants from their old home in the East. It is at least noticeable that in the Sumerian language of primitive Babylonia the horizon was called *kharra* or *khurra*, a word which corresponds letter for letter with the name of Horus. The fact may, of course, be accidental, and the name of the Egyptian god may really be derived from the same root as that from which the word for "heaven" has come, and which means "to be high." But the conception of the twin-mountains between which the sun-god comes forth every morning, and between which he passes again at nightfall, is of Babylonian origin. On early Babylonian seal-cylinders we see him stepping through the door, the two leaves of which have been flung back by its warders on either side of the mountains, while rays of glory shoot upward from his shoulders. The mountains were called Mas, "the twins," in Sumerian; and the great Epic of Chaldaea narrated how the hero Gilgames made his way to them across the desert, to a land of darkness, where scorpion-men, whose heads rise to heaven while their breasts descend to hell, watched over the rising and the setting of the sun. It is difficult to believe that such a conception of the horizon could ever have arisen in Egypt. There the Delta is a flat plain with no hills even in sight, while in the valley of Upper Egypt there are neither high mountains nor twin peaks.

Horus himself is, I believe, to be found in the Babylonian inscriptions. Mention is occasionally made in them of a god Khar or Khur, and in contracts of the time of Khammurabi (B.C. 2200) we find the name of Abi-Khar, "my father is Khar." But the age of Khammurabi was one of intercourse between Babylonia and Egypt, and the god Khar or Horus is therefore probably
borrowed from Egypt, just as a seal-cylinder informs us was the case with Anupu or Anubis.¹

But though the name of Khar or Khur is and must remain Egyptian, Horus has much in common with the Babylonian sun-god Nin-ip. They are both warrior-gods; and just as the followers of Horus were workers in iron, so Nin-ip also was the god of iron. One of his titles, moreover, is that of “the southern sun”; and on a boundary-stone the eagle standing on a perch is stated to be “the symbol of the southern sun.”²

The goddess with whom Horus of Nekhen was associated was Nekhbit with the vulture’s head. Her temple stood opposite Nekhen at El-Kab on the eastern bank of the Nile, and at the end of the long road which led across the desert from the Red Sea. It was at once a sanctuary and a fortress defending Nekhen on the east. But Nekhbit was the goddess not only of Nekhen, but of all Southern Egypt. We find her in the earliest inscriptions on the sacred island of Sehel in the Cataract, where she is identified with the local goddess Sati. We find her again at Thebes under the name of Mut, “the mother.” Her supremacy, in fact, went back to the days when Nekhen was the capital of the south, and its goddess accordingly shared with it the privileges of domination. When Nekhen fell back into the position of a small provincial town, Nekhbit also participated in its decline. Under the Theban dynasties, it is true, the name of Mut of Karnak became honoured throughout Egypt, but her origin by that time had been forgotten. The Egyptian who brought his offering to Mut never

¹ Cf. Sayce, TSBA., Nov. 1898. In one case the name of the god is written Kha-ar. In VAI. ii. 55. 36, Khur-galzu, “Horus, thou art great!” is given as the name of a Sumerian goddess.

² Nin-ip was identified with the planet Saturn, like “Horus the bull.”
realised that behind the mask of Mut lay the features of Nekhbit of Nekhen.

Mut, however, continued to wear the vulture form, and the titles assumed by the king still preserved a recollection of the time when Nekhbit was the presiding goddess of the kingdom of the south. From the days of Menes onward, in the title of "king of Upper and Lower Egypt," while the serpent of Uazit symbolised the north, the vulture of Nekhbit symbolised the south. At times, indeed, the uræus of Uazit is transferred to Nekhbit; but that was an epoch when it had come to signify "goddess," as the Horus-hawk signified "god." From the earliest ages, however, the plant which denoted the south, and formed part of the royal title, was used in writing her name. She was emphatically "the southerner," the mistress of the south, just as her consort, the mummified Horus, was its lord.

The euhemerising legends of Edfu made Horus the faithful vassal of his liege lord Ra Harmakhis of Heliopolis. But from a historical point of view the relations between the two gods ought to have been reversed, and the legends themselves contained a reminiscence that such was the case. In describing the victorious march of Horus and his followers towards the north, they tell us how he made his way past Heliopolis into the Delta, and even established one of his "forges" on its easternmost borders. The Horus kings of Upper Egypt made themselves masters of the northern kingdom, introducing into it the divine hawk they worshipped and the Horus title over their names.

The sun-god of Heliopolis was represented, like the gods of Babylonia, as a man and not as a hawk. He was known as Tum or Atmu, who, in the later days of religious syncretism, was distinguished from the other forms of the sun-god as representing the setting sun.
But Tum was the personal name of the sun-god; the sun itself was called Ra. As time went on, the attributes of the god were transferred to the sun; Ra, too, became divine, and, after being first a synonym of Tum, ended by becoming an independent deity. While Tum was peculiarly the setting sun, Ra denoted the sun-god in all his forms and under all his manifestations. He was thus fitted to be the common god of all Egypt, with whom the various local sun-gods could be identified, and lose in him their individuality. Ra was a word which meant "the sun" in all the dialects of the country, and its very want of theological associations made it the starting-point of a new phase of religious thought.

It was not until the rise of the Twelfth Dynasty that a special temple was built to Ra in Heliopolis. Up to that time Ra had been content to share with Tum the ancient temple of the city, or rather had absorbed Tum into himself and thus become its virtual possessor. But his religious importance goes back to prehistoric times. The temple of Heliopolis became the centre of a theological school which exercised a great influence on the official religion of Egypt. It was here that the sun-worship was organised, and the doctrine of creation by generation or emanation first developed; it was here, too, that the chief gods of the State religion were formed into groups of nine.

The doctrine of these Enneads or groups of nine was destined to play an important part in the official creed. From Heliopolis it spread to other parts of Egypt, and eventually each of the great sanctuaries had its own

1 It was then that the two obelisks were erected in front of the temple by Usertesen I., which caused it to be known as Hât-Benbeni, "the house of the two obelisks."

2 The members of the Ennead of Heliopolis or On are named in the Pyramid texts (Pepi ii. 666) Tum, Shu, Tefnut, Seb, Nut, Osiris, Isis, Set, and Nebhât.
Ennead, formed on the model of that of Heliopolis. At Heliopolis the cycle of the nine supreme gods contained Shu and Tefnut, Seb and Mut, Osiris and Isis, Set and Nebhât, the four pairs who had descended by successive acts of generation from Tum, the original god of the nome. We owe the explanation and analysis of the Ennead to Professor Maspero, who has for the first time made the origin of it clear.¹

Tum, who is always represented in human form, was the ancient sun-god and tutelary deity of Heliopolis. To him was ascribed the creation of the world, just as it was ascribed by each of the other nomes to their chief god. But whereas at the Cataract the creator was a potter who had made things from clay, or at Memphis an artist who had carved them out of stone, so it was as a father and generator that Tum had called the universe into being. In the Book of the Dead it is said of him that he is “the creator of the heavens, the maker of (all) existences, who has begotten all that there is, who gave birth to the gods, who created himself, the lord of life who bestows upon the gods the strength of youth.” An origin, however, was found for him in Nu, the primeval abyss of waters, though it is possible that Professor Maspero may be right in thinking that Nu really owes his existence to the goddess Nut, and that he was introduced into the cosmogony of Heliopolis under the influence of Asiatic ideas. However this may be, Shu and Tefnut, who immediately emanated from him, apparently represented the air. Later art pictured them in Asiatic style as twin lions sitting back to back and supporting between them the rising or setting sun.² But an old

¹ See his Études de Mythologie et d’Archéologie égyptiennes, ii. p. 337 sqq.

² Similarly, on early Babylonian seal-cylinders the leaves of the folding doors through which the sun-god comes forth at daybreak are surmounted
legend described Shu as having raised the heavens above the earth, where he still keeps them suspended above him like the Greek Atlas. A text at Esna, which identifies him with Khnum, describes him as sustaining "the floor of the sky upon its four supports" or cardinal points; "he raised Nut, and put himself under her like a great column of air." Tefnut, his twin sister, was the north wind, which gives freshness and vigour to the world.

The next pair in the Ennead of Heliopolis were Seb and Nut, the earth and the firmament, who issued from Shu and Tefnut. Then came Osiris and Isis, the children of the earth and sky, and lastly Set and Nebhât, the one the representative of the desert land in which the Asiatic nomads pitched their tents, the other of the civilised Egyptian family at whose head stood Neb-hât, "the lady of the house." Upon the model of this Ennead two other minor Enneads were afterwards formed.

But it was only its first father and generator who was the god of the nome in which the temple of Heliopolis stood. The deities who were derived from him in the priestly cosmogony were fetched from elsewhere. They were either elementary deities like Shu and Seb, or else deities whose worship had already extended all over Egypt, like Osiris and Isis. The goddess Nebhât seems to have been invented for the purpose of providing Set with a sister and a consort; perhaps Tefnut, too, had originally come into existence for the same reason.

The Ennead, once created, was readily adopted by the other nomes of Egypt. It provided an easy answer to that first question of primitive humanity: what is the by lions. See the illustration in King, Babylonian Religion and Mythology, p. 32. (The genuineness of this cylinder has been questioned without good reason.)
origin of the world into which we are born? The answer was derived from the experience of man himself; as he had been born into the world, so, too, it was natural to suppose that the world itself had been born. The creator must have been a father, and, in a land where the woman held a high place in the family, a mother as well. Though Tum continued to be pictured as a man, no wife was assigned him; father and mother in him were one.

It is impossible not to be reminded of similar supreme gods in the Semitic kingdoms of Asia. Asshur of Assyria was wifeless; so also was Chemosh of Moab. Nor does the analogy end here. Creation by generation was a peculiarly Semitic or rather Babylonian doctrine. The Babylonian Epic of the Creation begins by describing the generation of the world out of Mummu or Chaos. And the generation is by pairs as in the Ennead of Heliopolis. First, Mummu, the one primeval source of all things; then Lakhmu and Lakhamu, who correspond with Shu and Tefnut; next, Ansar and Kisar, the firmament and the earth; and lastly, the three great gods who rule the present world. Of one of these, Ea, the ruler of the deep, Bel-Merodach the sun-god was born.

Between the Babylonian and the Egyptian schemes the differences are slight. In the Ennead of Heliopolis, Tum, the offspring of Nu, takes the place of Mummu, the watery chaos; but this was because he was the god of the State, and had therefore to be made the creator and placed at the head of the gods. It merely interposes another link in the chain of generation, separating Nu from the two elemental deities which in the Babylonian scheme proceeded immediately from it. For Nu was

1 The wife occasionally provided for Asshur by the scribes was a mere grammatical abstraction, like Tumpt, the feminine of Tum, whose name is now and then met with in late Egyptian texts.
the exact equivalent of the Babylonian Mummu. Both denote that watery chaos out of which, it was believed, all things have come. And what makes the fact the more remarkable is, that though the conception of a primeval watery chaos was natural in Babylonia, it was not so in Egypt. Babylonia was washed by the waters of the Persian Gulf, out of which Ea, the god of the deep, had arisen, bringing with him the elements of culture, and the waves of which at times raged angrily and submerged the shore. But the Egyptians of history lived on the banks of a river and not by the sea; it was a river, too, whose movements were regular and calculable, and which bestowed on them all the blessings they enjoyed. So far from being an emblem of chaos and confusion, the Nile was to them the author of all good. I do not see how we can avoid the conclusion that between the Ennead of Heliopolis with its theory of cosmology, and the cosmological doctrines of Babylonia, a connection of some sort must have existed.¹

Indeed, the native name of Heliopolis is suggestive of Asiatic relations. It is the On of the Old Testament, and was called On of the north to distinguish it from another On, the modern Erment, in the south. It was symbolised by a fluted and painted column of wood,² in which some have seen an emblem of the sun-god, like the sun-pillars of Semitic faith. But the name of On was not confined to Egypt. There was another Heliopolis in Syria, called On of the Beka’a by Amos (i. 5), where the sun-god was worshipped under the form of a stone. And in Palestine itself Beth-el, “the house of

¹ One of the old formulæ embedded in the Pyramid texts (Teta 86) reads like a passage from a Sumerian hymn: “Hail to thee, great deep (ageb), moulder of the gods, creator of men.” It belongs to Babylonia rather than to Egypt, where the “great deep” could have been a matter only of tradition.

² See Petrie, Medum, p. 30.
God," was known in earlier ages as Beth-On. It is true that the name of On may have been carried into Asia in the days when the Hyksos dynasties ruled over Egypt, but it is more probable that both Beth-On and the On near Damascus go back to an older date. In any case they testify to some kind of contact between the sun-worship of Heliopolis in Egypt and that of Syria and Palestine.¹

Between Tum, the sun-god of Northern Egypt, and Horus, the sun-god of the South, there was one notable difference. While Horus was a hawk, Tum was a man. In this respect, again, he resembled the gods of Babylonia, who are always depicted in human form. It is difficult to find any other Egyptian deity who was similarly fortunate. Osiris, indeed, was originally a man, but at an early date he became confounded with his symbol, the ram, in his title of "lord of Daddu." Professor Maspero thinks that Khnum at the Cataract may also have been originally a man; but if so, he too became a ram before the beginning of history. Ptaḥ of Memphis and Anher of This are the only other gods who appear consistently in human shape, and Ptaḥ is a mummy, while Anher, like Tum, was the sun.²

With the adoption of the Ennead and the cosmological ideas it embodied, a new element entered into the theology of the Egyptian temples. This was the identification of one god with another, or, to speak more exactly, the loss of their individuality on the part of the gods. The

¹ The existence of other cities of the name in Upper Egypt, "On of the south," now Erment, and On, now Dendera, shows that it must go back to the earliest epoch of Pharaonic Egypt. I believe that it is the Sumerian wn, "city," and that the column which represented it hieroglyphically denoted "a foundation" or "settlement."

² It will be shown in a future lecture that Osiris was the mummified Anher. One is tempted to ask whether Ptaḥ is not similarly the mummified Tum?
process was begun when the priests of Heliopolis took such of the divinities as were recognised throughout Egypt, and transmuted them into successive phases in the creative action of their local god. It was completed when other religious centres followed the example of Heliopolis, and formed Enneads of their own. In each case the local god stood of necessity at the head of the Ennead, and in each case also he was assimilated to Tum. Whatever may have previously been his attributes, he thus became a form of the sun-god. A dual personality was created, which soon melted into one.

But it was not as Tum that the sun-god of Heliopolis thus made his way victoriously through the land of Egypt. It was under the more general and undefined name of Ra that he was accepted in the Egyptian sanctuaries. Tum remained the local god of Heliopolis, or else formed part of a solar trinity in which he represented the setting sun. But Ra became a divine Pharaoh, in whom the world of the gods was unified.

The kings of the Fifth Dynasty called themselves his sons. Hitherto the Pharaohs had been incarnations of the sun-god, like the earlier monarchs of Babylonia; henceforward the title of Horus was restricted to their doubles in the other world, while that of “Son of the Sun” was prefixed to the birth-name which they bore on earth. The same change took place also in Babylonia. There it was due to the invasion of foreign barbarians, and the establishment of a foreign dynasty at Babylon, where the priests refused to acknowledge the legitimacy of a king who had not been adopted as son by the sun-god Bel-Merodach. Perhaps a similar cause was at work in Egypt. The Fifth Dynasty came from Elephantine, an island which was not only on the extreme frontier of Egypt, but was inhabited then as now by a non-Egyptian race; it may be that the price of
their acknowledgment by the priests and princes of Memphis was their acceptance of the title of "Son of Ra." It narrowed their pretensions to divinity, and at the same time implied their submission to the god of the great sanctuary which stood in such close relations with Memphis. As we have seen, the first monument on which the winged solar disc is found is that of a king of the Fifth Dynasty; it there overshadows his figure and his two names; but though the hawk of Horus stands above the name of his double, his birth-name is without the title of "Son of Ra."

When once the principle had been adopted that the leading gods of Egypt were but varying forms of the sun-god, it was easy to construct Enneads, whatever might be the number of the deities it was wished to bring into them. Thus at Heliopolis itself Horus the son of Isis was introduced, his confusion with the sun-god Horus facilitating the process. At This, Anher was identified with Shu; at Thebes, Amon was made one with Tum and Ra, with Mentu and Mut. Where a goddess was at the head of the local Pantheon the process was the same; she interchanged with the other goddesses of the country, and even with Tum himself. At all events, Horapollo (i. 12) states that Nit of Sais was at once male and female.

One result of all this kaleidoscopic interchange was the growth of trinities in which the same god appears under three separate forms. At Heliopolis, for example, Harmakhis became identified with Tum, and the trinity of Tum, Ra, and Harmakhis grew up, in which Harmakhis was the sun of the morning and Tum of the evening, while Ra embodied them both. From one point of view, in fact, Harmakhis and Tum were but different aspects under which Ra could be envisaged; from another point, Ra, Tum, and Harmakhis were three persons in one god.
I believe that Professor Maspero is right in holding that the Egyptian trinity is of comparatively late origin and of artificial character. He points out that it presupposes the Ennead, and in some cases, at least, can be shown to have been formed by the union of foreign elements. Thus at Memphis the triad was created by borrowing Nefer-Tum from Heliopolis and Sekhet from Latopolis, and making the one the son of the local god Ptah, and the other his wife. The famous trinity of Osiris, Isis, and Horus, which became a pattern for the rest of Egypt, was formed by transferring Nebhât and Anubis, the allies of Osiris, to his enemy Set, and so throwing the whole of the Osirian legend into confusion. The trinity of Thebes is confessedly modern; it owed its origin to the rise of the Theban dynasties, when Thebes became the capital of Egypt, and its god Amon necessarily followed the fortunes of the local prince. Mut, "the mother," a mere title of the goddess of Southern Egypt, was associated with him, and the triad was completed by embodying in it Ptah of Memphis, who had been the chief god of Egypt when Thebes was still a small provincial town. At a subsequent date, Khonsu, the moon-god, took the place of Ptah.

We can thus trace the growth of the Egyptian trinity and the ideas and tendencies which lay behind it. It was the culminating stage in the evolution of the religious system which took its first start among the priests of Heliopolis. First creation by means of generation, then the Ennead, and lastly the triad and the trinity—such were the stages in the gradual pro-

---

1 Études de Mythologie et d'Archéologie égyptiennes, ii. p. 270 sqq.
2 This has been proved by a stela of Antef iv. of the Eleventh Dynasty, discovered by M. Legrain in 1900, in the temple of Ptah. Khonsu was a mere epithet of the moon-god, meaning "wanderer." In a later age Khonsu was himself superseded by Mentu.
cess of development. And the doctrine of the trinity itself reached its highest point of perfection in that worship of Osiris of which I shall speak in a future lecture.

But the Ennead had other results besides the Egyptian doctrine of the trinity. Generation in the case of a god could not be the same as in the case of a man. The very fact that Tum was wifeless proved this. It was inevitable, therefore, that it should come to be conceived of as symbolical like the generation of thought, all the more since the deities who had proceeded from Tum were all of them symbols representing the phenomena of the visible world. Hence the idea of generation passed naturally into that of emanation, one divine being emanating from another as thought emanates from thought. And to the Egyptian, with his love of symbolism and disinclination for abstract thought, the expression of an idea meant a concrete form. Seb and Nut were the divine ideas which underlay the earth and the firmament and kept them in existence, but they were at the same time the earth and the firmament themselves. They represented thought in a concrete form, if we may borrow a phrase from the Hegelian philosophy.

The principle of emanation was eagerly seized upon by Greek thinkers in the days when Alexandria was the meeting-place of the old world and the new. It afforded an explanation not only of creation, but also of the origin of evil, and had, moreover, behind it the venerable shadow of Egyptian antiquity. It became the basis and sheet-anchor of most of the Gnostic systems, and through them made its way into Christian thought. From another point of view it may be regarded as an anticipation of the doctrine of evolution.

The work of the priestly college of Heliopolis was
accomplished long before the Pyramid texts were written under the kings of the Fifth and Sixth Dynasties. The Ennead appears in them as a long established doctrine, with all its consequences. The solar faith had laid firm hold of Egyptian religion, and gained a position from which it was never to be dislodged. Henceforward Egyptian religion was permeated by the ideas and beliefs which flowed from it, and the gods and goddesses of the land assumed a solar dress. Under the Nineteenth Dynasty, if not before, a new view of the future life obtained official sanction, which substituted the sun-god for Osiris and the solar bark for the Osirian paradise. But I must leave an account of it to another occasion, and confine myself at present to the last and most noteworthy development of solar worship in Egypt.

It is perhaps hardly correct to apply to it the term development. It was rather a break in the religious tradition of Egypt, an interruption in the normal evolution of the Egyptian creed, which accordingly made but little permanent impression on the religious history of the nation. But in the religious history of mankind it is one of the most interesting of episodes. Like Mosaism in Israel, it preached the doctrine of monotheism in Egypt; but unlike Mosaism, its success was only temporary. Unlike Mosaism, moreover, it was a pantheistic monotheism, and it failed accordingly in its struggle with the nebulous polytheism of Egypt.

One of the last Pharaohs of the Eighteenth Dynasty was Amon-hotep IV. Since the conquest of Syria by his ancestor Thothmes III., and the establishment of an empire which extended to the banks of the Euphrates, Asiatic manners and customs had poured into Egypt in an ever-increasing flood, and with them the ideas and religious beliefs of the Semitic East. Amon-hotep III., the father of Amon-hotep IV., had maintained the older
traditions of the Egyptian court, so far at least as religion was concerned, though his mother and wife had alike been foreigners. But his son appears to have been young at the time of his father's death. He was accordingly brought up under the eye and influence of his mother Teie, and his temperament seems to have seconded the teaching he received from her. His features are those of a philosophic visionary rather than of a man of action, of a religious reformer rather than of a king. He flung himself eagerly into a religious movement of which he was the mainspring and centre, and for the first time in history there was persecution for religion's sake.

For numberless centuries the Egyptian had applied the title of "the one god" to the divinity he was adoring at the moment, or who presided over the fortunes of his city or nome. But he did not mean to exclude by it the existence of other deities. The "one god" was unique only to the worshipper, and to the worshipper only in so far as his worship for the moment was addressed to this "one god" alone. When with the growth of the solar theory the deities of Egypt began to be resolved into one another, the title came to signify that attribute of divinity which unified all the rest. But to the Egyptian, it must be remembered, the attribute was a concrete thing; and though in one sense Amon and Khnum and Horus denoted the attributes of Ra, in another sense they were distinct personalities with a distinct history behind them. The result was what I have called a nebulous polytheism, in which the individual deities of the Egyptian Pantheon had melted like clouds into one another; they had lost their several individualities, but had not gained a new individuality in return. The conservative spirit, which forbade the Egyptian to break with the traditions of the past and
throw aside any part of his heritage, prevented him from taking the final step, and passing out of polytheism into monotheism.

It was just this step, however, that was taken by Amon-hotep iv. and his followers, and which at once stamps the non-Egyptian character of his religious reformation. Henceforward there was to be but one God in Egypt, a God who was omnipresent and omniscient, existing everywhere and in everything, and who would brook no rival at his side. He was not, indeed, a new god, for he had already revealed himself to the generations of the past under the form of Ra, and his visible symbol was the solar disc. But Ra had been ignorantly worshipped; unworthy language had been used of him, and he had been confounded with gods who were no gods at all. The new and purified conception of the supreme divinity needed a new name under which it could be expressed, and this was found in Aten, "the solar disc," or Aten-Ra, "the disc of the sun."

It was not probable that Amon of Thebes and his worshippers would bow their heads to the new faith without a struggle. It was Amon who had led the fathers of Amon-hotep iv. to victory, who had given them their empire over the world, and upon whose city of Thebes the spoils of Asia had been lavished. A fierce contest broke out between the Theban priesthood and the heretical king. The worship of Amon was proscribed, his very name was erased from the monuments on which it was engraved, and a shrine of the rival deity was erected at the very gates of his ancient temple. The Pharaoh changed his own name to that of Khu-n-Aten, "the glory of the solar disc," and thereby publicly proclaimed his renunciation of the religion of which he was the official head.

But in the end the priests of Amon prevailed. Khu-n-Aten was forced to leave the capital of his fathers,
and, carrying with him the State archives and the adherents of the new faith, he built a new city for himself midway between Minia and Siût, where the mounds of Tel el-Amarna now mark its site. Here, surrounded by a court which was more than half Asiatic in blood and belief, he raised a temple to the new God of Egypt, and hard by it a palace for himself. The new creed was accompanied by a new style of art; the old traditions of Egyptian art were thrown aside, and a naturalistic realism, sometimes of an exaggerated character, took their place. The palace and temple were alike made glorious with brilliant painting and carved stone, with frescoed floors and walls, with columns and friezes inlaid with gold and precious stones, with panels of pictured porcelain, and with statuary which reminds us of that of later Greece. Gardens were planted by the edge of the Nile, and carriage roads constructed in the desert, along which the king and his court took their morning drives. Then, returning to his palace, the Pharaoh would preach or lecture on the principles and doctrines of the new faith.

It was officially called "the doctrine," which, as Professor Erman remarks, shows that it possessed a dogmatically-formulated creed. Its teachings are embodied in the hymns inscribed on the walls of the tombs of Tel el-Amarna. The God, whose visible symbol is the solar disc, is He, as we learn from them, who has created all things, "the far-off heavens, mankind, the animals and the birds; our eyes are strengthened by his beams, and when he reveals himself all flowers grow and live; at his rising the pastures bring forth, they are intoxicated before his face; all the cattle skip on their feet, and the birds in the marshes flutter with joy." It is he "who

1 For the architectural plan of the temple, see Erman, Life in Ancient Egypt, Eng. tr., p. 287.
brings in the years, creates the months, makes the days, reckons the hours; he is lord of time, according to whom men reckon." ¹ Beside Him, "there is no other" God.

"Beautiful is thy setting," begins another hymn, "O living Aten, thou lord of lords and king of the two worlds! When thou unitest thyself with the heaven at thy setting, mortals rejoice before thy countenance, and give honour to him who has created them, and pray to him who has formed them in the presence of Khu-n-Aten, thy son, whom thou lovest, the king of Egypt who liveth in truth. All Egypt and all lands within the circle that thou treadest in thy glory, praise thee at thy rising and at thy setting. O God, who in truth art the living one, who standest before our eyes, thou createst that which was not, thou formest it all; we also have come into being through the word of thy mouth." ²

¹ Erman, Life in Ancient Egypt, Eng. tr., p. 262.
² Another strophe of the Hymn to Aten, as translated by Professor Breasted (De Hymnis in Solem sub rege Amenophide iv. conceptis, p. 47), is equally explicit: "Thou hast created the earth according to thy pleasure, when thou wast alone, both all men and the cattle great and small; all who walk upon the earth, those on high who fly with wings; the foreign lands of Syria (Khar) and Cush as well as the land of Egypt; each in its place thou appointest, thou providest them with all that they need; each has his granary, his stores of grain are counted. Diverse are the languages of men, more different than their shape is the colour of their skin, (for) thou hast distinguished the nations of the world (one from the other)." In the succeeding strophe the monotheism of the worshipper of Aten, in whose eyes even the sacred Nile was the creature of the one true God, appears in striking contrast to the ordinary polytheism of Egypt (Breasted, l.c. p. 53): "Thou createst the Nile in the other world, thou bringest it at thy pleasure to give life to mankind; for thou hast made them for thyself, O lord of them all who art ever with them, O lord of all the earth who risest for them, O sun of day (the mighty one in!) the remotest lands, thou givest them their life, thou sendest forth the Nile in heaven, that it may descend for them; it raises its waves mountain high like the sea, it waters the fields of their cities. How glorious are thy counsels! O lord of eternity, thou art a Nile in heaven for foreign men and cattle throughout all the earth! They walk on their feet, (and) the Nile cometh to Egypt from the other world."
The solar disc was thus, as it were, the mask through which the supreme Creator revealed himself. And this Creator was the one true living God, living eternally, brooking the worship of no other god at his side, and, in fact, the only God who existed in truth. All other gods were false, and the followers of Aten-Ra were accordingly called upon to overthrow their worship and convert their worshippers. At the same time, Aten was the father of all things; he had called all things into existence by the word of his mouth, men equally with the beasts and birds, the flowers and the far-off heaven itself. If, therefore, men refused to worship him, it was because they had been led astray by falsehood and ignorance, or else were wilfully blind.

Whatever measure of success the reforms of Khu-n-Aten attained among the natives of Egypt, they must have possessed in so far as they represented a reformation, and not the introduction of a new and foreign cult. There must have been a section of the people, more especially among the educated classes, whose religious ideas were already tending in that direction, and who were therefore prepared to accept the new "doctrine." The language often used of the gods, if strictly interpreted, implied a more or less modified form of monotheism; the Egyptian deities, as we have seen, had come to be resolved into manifestations of the sun-god, and the symbol of the new faith enabled it to be connected with the ancient worship of Ra. The old sun-worship of Heliopolis formed a bridge which spanned the gulf between Amon and Aten. Indeed, the worship of the solar disc itself was not absolutely strange. An Egyptian, for instance, who was buried at Kom el-Ahmar, opposite El-Kab, in the reign of Thothmes III., speaks of being "beloved by the beams of the solar disc" (Aten-Ra); and though no determinative of divinity is attached
to the words, it was but a step forward to make the
disc the equivalent of the sun-god.

Nevertheless, between the "doctrine" of Khu-n-Aten
and the older Egyptian ideas of the sun-god there was a
vast, if not impassable, distance. The "doctrine" was no
result of a normal religious evolution. That is proved
not only by the opposition with which it met and the
violent measures that were taken to enforce it, but still
more by its rapid and utter disappearance or extermina-
tion after the death of its royal patron. It came from
Asia, and, like the Asiatic officials, was banished from
Egypt in the national reaction which ended in the rise
of the Nineteenth Dynasty.

The god of Khu-n-Aten, in fact, has much in common
with the Semitic Baal. Like Baal, he is the "lord of
lords," whose visible symbol is the solar orb. Like Baal,
too, he is a jealous god, and the father of mankind. It
is true that Baal was accompanied by the shadowy Baalat;
but Baalat, after all, was but his pale reflection, necessi-
tated by the genders of Semitic grammar; and in some
parts of the Semitic world even this pale reflection was
wanting. Chemosh of Moab, for instance, and Asshur
of Assyria were alike wifelss.

On the other hand, between Aten and the Semitic
Baal there was a wide and essential difference. The
monotheism of Khu-n-Aten was pantheistic, and as a
result of this the god he worshipped was the god of the
whole universe. The character and attributes of the
Semitic Baal were clearly and sharply defined. He
stood outside the creatures he had made or the children
of whom he was the father. His kingdom was strictly
limited, his power itself was circumscribed. He was the
"lord of heaven," separate from the world and from the
matter of which it was composed.

But Aten was in the things which he had created;
he was the living one in whom all life is contained, and at whose command they spring into existence. There was no chaos of matter outside and before him; he had created "that which was not," and had formed it all. He was not, therefore, a national or tribal god, whose power and protection did not extend beyond the locality in which he was acknowledged and the territory on which his high places stood; on the contrary, he was the God of the whole universe; not only Egypt, but "all lands" and all peoples are called upon to adore him, and even the birds and the flowers grow and live through him. For the first time in history, so far as we know, the doctrine was proclaimed that the Supreme Being was the God of all mankind.

The fact is remarkable from whatever point of view it may be regarded. The date of Khu-n-Aten is about 1400 B.C., a century before the Exodus and the rise of Mosaism. More than once it has been suggested that between Mosaism and the "doctrine" of Aten there may have been a connection. But in Mosaism we look in vain for any traces of pantheism. The Yahveh of the Commandments stands as much outside His creation as the man whom He had made in His own image; His outlines are sharply defined, and He is the God of the Hebrews rather than of the rest of the world. The first Commandment bears the fact on its forefront: other nations have their gods whose existence is admitted, but Yahveh is the God of Israel, and therefore Him only may Israel serve.
LECTURE V.

ANIMAL WORSHIP.

St. Clement of Alexandria thus describes the religion of his Egyptian neighbours (Pædag. iii. 2): "Among (the Egyptians) the temples are surrounded with groves and consecrated pastures; they are provided with propylæa, and their courts are encircled with an infinite number of columns; their walls glitter with foreign marbles and paintings of the highest art; the sanctuary is resplendent with gold and silver and electrum, and many-coloured stones from India and Ethiopia; the shrine within it is veiled by a curtain wrought with gold. But if you pass beyond into the remotest part of the enclosure in the expectation of beholding something yet more excellent, and look for the image which dwells in the temple, a pastophorus or some other minister, singing a pæan in the Egyptian language with a pompous air, draws aside a small portion of the curtain, as if about to show us the god; and makes us burst into a loud laugh. For no god is found therein, but a cat, or a crocodile, or a serpent sprung from the soil, or some such brute animal... and the Egyptian deity is revealed as a beast that rolls itself on a purple coverlet."

St. Clement was a Christian philosopher and apologist, but the animal worship of the Egyptians was quite as much an object of ridicule to the pagan writers of Greece and Rome. "Who has not heard," says Juvenal (Sat
xv.),—"who has not heard, where Egypt's realms are named—

"What monster gods her frantic sons have framed?
Here Ibis gorged with well-grown serpents, there
The crocodile commands religious fear; . . .
And should you leeks or onions eat, no time
Would expiate the sacrilegious crime;
Religious nations sure, and blest abodes,
Where every orchard is o'errun with gods!"

A Roman soldier who had accidentally killed a cat was torn to pieces by the mob before the eyes of Diodorus, although the Romans were at the time masters of the country, and the reigning Ptolemy did his utmost to save the offender.¹ For the majority of the people the cat was an incarnate god.

This worship of animals was a grievous puzzle to the philosophers of the classical age. The venerable antiquity of Egypt, the high level of its moral code, and, above all, the spiritual and exalted character of so much of its religion, had deeply impressed the thinking world of the Roman Empire. That world had found, in a blending of Egyptian religious ideas with Greek metaphysics, a key to the mysteries of life and death; in the so-called Hermetic books the old beliefs and religious conceptions of Egypt were reduced to a system and interpreted from a Greek point of view, while the Neo-Platonic philosophy was an avowed attempt to combine the symbolism of Egypt with the subtleties of Greek thought. But the animal worship was hard to reconcile with philosophy; even symbolism failed to explain it away, or to satisfy the mind of the inquirer. Plutarch had boldly denied that the worship of an animal was in any way more absurd than that of an image; the deity, if so he chose, could manifest himself in either

¹ Diod. Sic. i. 83.
equally well. Porphyry had recourse to the doctrine of the transmigration of souls. If the soul migrated after death into the body of some lower animal, he urged, it would communicate to the latter a portion of the divine essence. But after all this was no explanation of the worship paid to the animal; the soul had not been worshipped while it was still in the body of its original possessor, and there was therefore no reason why it should be worshipped when it was embodied in another form. Moreover, metempsychosis in the Greek sense was never an Egyptian doctrine. All the Egyptian held was that the soul, after it had been justified and admitted to a state of blessedness, could enter for a time whatever material form it chose; could fly to heaven, for instance, in the body of a swallow, or return to the mummified body in which it had once dwelt. But such embodiments were merely temporary, and matters of free choice; they were like a garment, which the soul could put on and take off at will.

Modern writers have found it as difficult to explain the animal worship of ancient Egypt as the philosophers and theologians of Greece and Rome. Creuzer declared that it was the result of a poverty of imagination, and that the beasts were worshipped because they embodied certain natural phenomena. Lenormant argued, on the other hand, that it was due to a high spiritual conception of religion, which prevented the Egyptians from adoring lifeless rocks and stones like the other nations of antiquity. Of late the tendency has been to see in it a sort of totemism which prevailed among the aboriginal population of the country, and was tolerated by the higher religion of the Pharaonic immigrants. In this case it would represent the religion of the prehistoric race or races, and its admittance into the official religion would be paralleled by the history of Brahmanism, which
has similarly tolerated the cults and superstitions of the aboriginal tribes of India. Indeed, it is possible to discover an analogous procedure in the history of Christianity itself. The lower beliefs and forms of worship can be explained away wherever needful with the help of symbolism and allegory, while the mass of the people are left in the undisturbed enjoyment of the religious ideas and rites of their forefathers.

Recent discoveries, however, have cast a new light on the matter. The early monuments of Egyptian history, found in the neolithic graves and among the remains of the first dynasties, have shown that the animal worship of Egypt was only part of a larger system. Slate plaques, on which are represented the actions of Pharaohs who preceded Menes or were his immediate successors, prove that the prevailing system of religion must have been one closely akin to African fetishism. The gods appear frequently, but they always appear under the form of what in later times were regarded as their symbols. Sometimes the symbol is an animal or bird, but sometimes also it is a lifeless object. The human forms, to which we are accustomed in later Egyptian art, are absent;¹ there is nothing to tell us that the religion of the time was in any way distinguished from the fetishism of Dahomey or the Congo.

Thus on a slate plaque from Kom el-Âhmar (opposite El-Kab²) we see the Pharaoh entering the hall in which lie the bodies of his decapitated foes, while four standards are borne before him. On the first two are the hawks of Horus, on the third the jackal of Anubis, on the last

¹ Except in the case of Osiris at Abydos; Petrie, The Royal Tombs of the First Dynasty, pt. i. pl. xvi. 16; comp. also at Kom el-Âhmar, Hierakonpolis, pt. i. pl. xxvi. B, though here it seems to be the Pharaoh who is represented.

² Quibell in the Zeitschrift für Aegyptische Sprache, xxxvi. pls. xii., xiii.; Hierakonpolis, pt. i. pl. xxix.
an object which may be intended for a lock of hair. On the reverse of the plaque the god is bringing before him the prisoners of the north. But the god is a hawk, whose human hand grasps the rope by which the conquered enemy is dragged along. On a plaque of equally early date, found at Abydos, five standards are depicted, the foot of each of which is shaped like a hand holding a rope. Above the first two standards are the jackals of Anubis, on the next the ibis of Thoth, then the hawk of Horus, and, finally, the curious object which is the emblem of Min. On a still older plaque from the same locality the names of the cities ruled (or conquered) by the Pharaoh are inscribed, each within its battlemented wall, while above is the animal god by which it is said to be "beloved" or perhaps "destroyed." The last of the cities is "the royal" capital, above which stand the two hawks of Horus, who are perched on the standards of the king; behind it are the names of the other towns under the protection of the scorpion of Selk, the lion of Sekhet, and the hawk of Horus.

But we can trace the standards and the symbols upon

1 On a stela in the Wadi Maghara, in the Sinaitic Peninsula, Sahu-Ra of the Fifth Dynasty, divided into two figures, one with the crown of Lower Egypt the other with that of Upper Egypt, is standing before a standard on which are the two emblems of Southern and Northern Egypt, Set and Horus. Set is represented by his usual animal, but Horus by an uraeus serpent and the same symbol as that on the plaque (de Morgan, *Recherches sur les Origines de l'Égypte*, i. p. 233). As we learn from the legend of Seb recounted at At-Nebes (Saft el-Henna), the two relics preserved there were the uraeus and lock of hair of Ra. The lock of hair has practically the same form as the symbol we are considering here, and long before the legend had been concocted, Ra and Horus had been identified together (see Griffith, *Antiquities of Tell el-Yahudiyyeh, Seventh Memoir of the Egypt Exploration Fund*, pl. xxiii.);

2 De Morgan, *Recherches sur les Origines de l'Égypte*, ii. pls. ii. and iii.; Sayce in the *Proceedings of the Society of Biblical Archleology*, Feb. 1898. It will be noticed that Thoth is represented by the ibis and not by the ape.
them still farther back. M. de Morgan has pointed out that the rude and primitive boats painted on the pottery of the prehistoric graves have their prows ornamented with standards which are precisely the same in shape as the standards that were borne before the Pharaoh. On the top of one is perched a hippopotamus, on another a fish; on another is a flowering branch, on another the sail of a ship.\(^1\) We may conclude, therefore, that both standards and symbols were characteristic of the older population of the country whom the Pharaonic Egyptians found when they entered it. But the symbols had no connection with any kind of writing; we look in vain, either on the pottery or on any other object of prehistoric art, for hieroglyphic signs. The standard may have been adopted by the invading race from their conquered subjects, and so introduced into their system of writing; originally it was nothing but a primeval flagstaff at the prow of a boat. And, like the flagstaff, the symbol that served as a flag must have been of aboriginal invention.

Such, then, is the conclusion to which we are led by the newly-found monuments of early Egypt. On the Pharaonic monuments of that remote age the gods are not yet human; they are still represented by animals and other fetishes. And these fetishes have been borrowed from the older population of the valley of the Nile, along with the so-called standard on the top of which they were placed.

The standard with the emblem upon it denoted a nome in the historical days of Egypt. The emblem represented the god of the nome, or rather of the chief sanctuary in the nome. Where the god of the nome was Horus, the hawk appeared upon the standard; where two Horus-gods were worshipped, there were two hawks. As the prehistoric boat had been placed under the pro-

\(^1\) De Morgan, *Recherches sur les Origines de l’Égypte*, p. 93.
tection of the deity whose fetish or symbol was planted at its prow, so the nome was under the protection of the god whose emblem was erected on its standard. The standards borne before the Pharaoh on the plaque of Kom el-Ahmar were the standards of the nomes over which he claimed rule.

It would seem, then, that the god of a nome was in most instances the god of the aboriginal tribe which originally inhabited it, and that the symbols by which these gods were known were primitively the gods themselves. On the plaque of Abydos it is not Selk or Sekhet who is the protecting deity of the city, but the scorpion and the lion. And by the side of animals and birds, as we have seen, we find also inanimate objects which are on exactly the same footing as the animals and birds. The primitive religion of Egypt must have been a form of fetishism.

But in passing from the older population to the Asiatic immigrants it underwent a change. The same slate plaques which portray Horus as a hawk and Anubis as a jackal, represent the king under the likeness of a bull. It is a literal pictorial rendering of the phrase so often met with in the inscriptions, in which the Pharaoh is described as a bull trampling on his enemies. The animal has ceased to represent the actual reality, and has become a symbol.

And this symbolism, it will be noticed, accompanies the introduction of symbolic writing. The figure of the bull which denotes the Pharaoh, is as much a symbol as the fish which forms part of his name. It is therefore fair to conclude that the hawk which brings the captured enemy to the king is also a symbol. The fetish has become symbolic; the hawk is no longer a god in and for itself, but because it is the embodiment of the divine Horus.
It was but a step further to unite the symbol with the human form. The process involved the disuse of inanimate objects; only the living could be fitly joined together. Horus could be depicted as a man with a hawk's head; it was less easy to combine the symbol of Min with a man's limbs. Such anthropomorphising followed necessarily from the deification of the Pharaoh. The race which turned its human leader into a god was bound to represent its gods under human form. In Egypt, however, the older element in the population, with its religious ideas, was too strong to be wholly disregarded by the ruling caste. The compromise, which had transformed the fetish into a symbol, ended by retaining the animal forms of the gods, but in subordination to the form of man. Henceforth, for the State religion, Horus wore merely the mask of a hawk.¹

That the official figures of the gods were thus a compromise between two antagonistic currents of religious thought, appears very clearly when we compare Egypt with Babylonia. In Babylonia, also, there were symbols attached to the gods, some of them representing animals and birds, others inanimate objects. In Babylonia, moreover, the king was a god, both in his lifetime and after

¹ For late examples of the worship of animals like the cat, ram, swallow, or goose, as animals and not as incarnations of an official god, see Maspero, Études de Mythologie et d'Archéologie égyptiennes, ii. p. 395 sqq. The rarity of them is due to their representing private and domestic cults not recognised by the religion of the State. "The worship of the swallow, cat, and goose, which had commenced as the pure and simple adoration of these creatures in themselves, always remained so for the multitude. We must not forget that Orientals regard beasts somewhat differently from ourselves. They ascribe to them a language, a knowledge of the future, an extreme acuteness of the senses which allows them to perceive objects and beings invisible to man. It was not, indeed, all Egypt that worshipped in the beast the beast itself; but a considerable part of it which belonged almost entirely to the same social condition, and represented pretty much the same moral and intellectual ideas."
his death. But in Babylonia the figures of the gods of the State religion were all human; it was only the demons of the popular cult who were allowed to retain the bodies of beasts and birds. The gods themselves were all depicted in human form. The reason of this is simple: in Babylonia the Semitic conception of the deity was predominant; there was no fetishism to be conciliated, no animal worship to be reconciled with a higher faith. The emblems of the gods remained emblems, and the gods of heaven clothed themselves with the same form as the human god on earth.

In the retention of the primitive animal worship, therefore, we must see an evidence not only of the strength of that portion of the population to whom it originally belonged, but also of the conservative spirit which characterised the Egyptians. In this case, however, the conservative spirit was the result of the influence of the conquered race; art continued to represent Horus with the head of a hawk, just because those who believed him to be a bird continued to form an important part of the population. The popular cult and the popular superstitions were too widely spread to be disregarded.

Egyptian orthodoxy found a ready way in which to explain the animal forms of its gods. The soul, once freed from its earthly body, could assume whatever shape it chose, or rather, could inhabit as long as it would whatever body it chose to enter. And what was true of the human soul was equally true of the gods. They too were like men, differing indeed from men only in so far as they were already in the other world, and thus freed from the trammels and limitations of our present existence. The soul of Ra, which was practically Ra himself, could appear under the form of a bird, if so he willed. Transmigration from one body to another, in-
deed, never presented any difficulty to the Egyptian mind. It could be effected by the magician by means of his spells; and there were stories, like the folk-tales of modern Europe, which told how the life and individuality of a man could pass into the bodies of animals, and even into seeds and trees. The belief is common to most primitive peoples, and is doubtless due to the dreams in which the sleeper imagines himself possessed of some bodily form that is not his own.

We must then regard the animal worship of Egypt as the survival of an early fetishism. But it is a survival which has had to accommodate itself to the antagonistic conceptions of an anthropomorphic faith. By the side of the deified king the deified animal was allowed to remain, and man and beast were mixed together in religious art. It was parallel to the juxtaposition of pictorial ideographs and phonetically-spelt words in the writing of a later day. And just as it was only the cultivated classes to whom the written characters were symbols with a meaning other than that which they bore to the eye, so too it was only these same cultivated classes to whom the sacred animals were symbols and embodiments of the deity, rather than the deity itself. The masses continued to be fetish-worshippers, like the earlier inhabitants of the country from whom most of them drew their descent.

To this fact we must ascribe the extraordinary hold which the worship of animals had upon the Egyptian people as a whole up to the period of their conversion to Christianity. While the walls of the temple were covered with pictures in which the gods were represented in human or semi-human form, the inner shrine which they served to surround and protect contained merely the beast or bird in which the deity was believed to be incarnated for the time. When the god revealed himself
to his worshipper, it was as a hawk or a crocodile. The fact would be inexplicable if the priests alone were privileged to see him, as has often been maintained. Such, however, was not the case. Every Egyptian, whatever might be his rank and station, could follow the processions in the temple, could enter its inner chambers, and gaze upon the incarnated deity, provided only that he had conformed to the preliminary requirements of the ritual and were not unclean.\(^1\) The temple was not the exclusive property of a privileged caste; it was only the foreigner and the unbeliever who was forbidden to tread its courts. It was open to the Egyptian populace, and to the populace the sacred animals were the gods themselves.

We do not know whether the hawk which represented Horus, and in which the soul of the god tabernacled for a time, was distinguished from other hawks by special marks. We know, however, that this was the case with some of the sacred animals. According to Herodotus (iii. 28), the bull Apis of Memphis was required to be black, with a white triangle on his forehead, an eagle on his back, double hairs in his tail, and a beetle on his tongue; and though the extant figures of the god do not support the precise description given by the Greek writer, they show that certain characteristic marks were really required. In this way the incarnation of the god was separated from other animals of the same species, upon whom, however, some part of his divinity was reflected. Since any bull might have become the habitation of the deity, it was necessary to treat the whole species with respect:

The bull Apis was an incarnation of Ptah, "the new life of Ptah," as he is often called on the votive tablets. We must see in him accordingly the local fetish of the

pre-dynastic Egyptians who lived in the district where Memphis afterwards arose. In fact the bull was sacred throughout the whole of this region. In the neighbour-
ing city of Heliopolis the place of Apis was taken by another bull, Ur-mer, or Mnevis, as the Greeks miscalled him. Mnevis was the incarnation of the sun-god, and, like Apis, it was needful that he should be black. Nor was the worship of the bull confined to the north. At Erment also, near Thebes, Mentu, the god of the nome, was incarnated in the bull Bakis. The sanctity of the bull is not difficult to understand among an agricultural people in an early stage of development. In India the bull is still sacred; and Sir Samuel Baker tells us that the tribes of the Upper Nile still abstain from eating the flesh of the ox. In Phrygia the slaughter of an ox was punishable with death; the first king of the country was supposed to have been a peasant, and his ox-drawn cart was preserved in the temple of Kybelê. Among the Egyptians themselves, as we have seen, the Pharaoh was symbolised under the form of a bull at the very beginning of history.

The bull, then, must have been worshipped in the neighbourhood of Memphis and Heliopolis before it became the incarnation of Ptah or Ra. It follows, moreover, that as yet it was no one particular bull to whom divine honours were paid; there was no one particular bull into whom the soul of one of the gods of the

1 Late inscriptions call Bakh or Bakis "the living soul of Ra," but this was when Mentu and Ra had been identified together. Stelae of the Roman period, however, from Erment represent the sacred bull without any solar emblem, while by the side of it stands a hawk-headed crocodile crowned with the orb of the sun. It is possible that the latter may be connected with the hawk-headed crocodile, with the orb of the sun on its head and an uræus serpent at the end of its tail, which in Greek graffiti at Philæ is called Ptiris.

2 Nicolaus Damascen., Fr. 128, ed. Müller.
Pharaonic Egyptians had as yet entered, thus setting it apart from all others. The bull was still a fetish pure and simple; it was the whole species that was sacred, and not a single member of it.

That this was indeed the case, is proved by a custom which lasted down to the latest times. Not only was the sacred bull or the sacred hawk mummified after death, but other bulls and hawks also. There were cemeteries of mummified animals, just as there were cemeteries of mummified men. Vast cemeteries of cats have been found at Bubastis, at Beni-Hassan, and other places; so too there were cemeteries of hawks and crocodiles, of jackals and bulls. We are still ignorant of the exact conditions under which these creatures were embalmed and buried. It is impossible to suppose that a solemn burial was provided for all the individual members of a species which was accounted sacred in a particular nome, much less for all its individual members throughout Egypt, as seems to have been imagined by Herodotus (ii. 41); there must have been certain limitations within which such a burial was permitted or ordained. And sometimes there was no burial at all; the mummy of the sacred animal of Set, for instance, has never been found.

Still the fact remains that not only were the bodies of the Apis or the Mnevis mummified and consigned to a special burying-place, but the bodies of other bulls as well. Doubtless the Egyptian of the Pharaonic period had an excellent reason to give for the practice. Just as the servants of the prince were buried around their master, or as the ushebtï-figures were placed in the tomb of the dead, so the ordinary bull was interred like the divine incarnations of Ptah and Ra, in the hope that its double might accompany the spirit of the god in the other world. The scenes of country life painted on the
walls of the tombs contain pictures of sheep and cattle whose *kas* were, in some way or other, believed to exist in the Egyptian paradise, and a mummified bull had as much right to the hope of a future existence as a mummified man. The very act of embalming implied the possibility of its union with Osiris.

Egyptian logic soon converted the possibility into a fact. With the growth of the Osirian cult the dead Apis became, like the pious Egyptian, one with Osiris, the lord of the other world. His identity with Ptah paled and disappeared before his newer identity with Osiris. At first he was Osiris-Apis, “the Osirified bull-god,” as guardian only of the necropolis of Memphis; then as god also of both Memphis and Egypt in life as well as in death. Under the Ptolemies, Greek ideas gathered round the person of a deity who thus united in himself the earlier and later forms of Egyptian belief, and out of the combination rose the Serapis of the classical age, whose worship exercised so great an influence on the Roman world. In the features of the human Serapis, with his majestic face and flowing beard, it is difficult to recognise the bull-god of primitive Egypt.

The history of Serapis is on a large scale what that of the other sacred animals of Egypt is on a smaller scale. Mnevis was a lesser Apis; as Heliopolis waned before Memphis, so did its divine bull before the rival deity of the capital. They had both started on an equal footing, and had followed the fortunes of the cities where they were adored. At Mendes it was not a bull, but a ram, that was the object of worship, and in which the priests beheld an incarnation of Ra, though the accidental fact that the word *ba* meant alike “ram” and “soul” caused later generations to identify it with the “soul” of Osiris. In the Fayyûm it was the crocodile which naturally be-

1 De Rougé, *Monnaies de nomes*, p. 46.
came the god Sebek or Sukhos, and at a later time Petesukhos, "the gift of Sukhos." In the latter name we read the signs of a growing disinclination to see in the animal the god himself or even his soul or double; the Sukhos becomes "the gift of Sukhos," separate from the god, and bestowed by him upon man.

There were other nomes besides the Fayyûm in which the crocodile was worshipped. It was the sacred animal of Onuphis in the Delta, and of Ombos in the far south of Egypt. But we must not expect to find a Sebek and a sacred crocodile always accompanying one another. There could be cases in which the crocodile was identified with other gods than Sebek,—with Set, for example, as at Nubti, near Dendera. The sacred animal existed before the god whose incarnation he afterwards became. The neolithic races were in the valley of the Nile before the Pharaonic Egyptians, and the deities they adored were consequently also there before the gods of the intruding race. Ptah, with his human figure, would not have been transformed into the bull Apis if the bull had not been already in possession.

The name of the god Thoth is itself a proof of this. Thoth was the god of Hermopolis, the modern Eshmûnân, and his patronage of writing and books shows that he must have been the deity of the Pharaonic race. The god to whom the invention of the hieroglyphs was ascribed, could not have been the god of an illiterate population.

Now the Egyptian form of the name Thoth is Dehuti (or Zehuti), "he who belongs to the ibis." Thoth, there-

1 Griffith (Proc. of Society of Biblical Archaeology, xxi. p. 278) has recently proposed to see in Dehuti a derivative from the name of the nome Dehut, like Anzti, the title of Osiris at Busiris, from the name of the nome Anzet. But this is "putting the cart before the horse." It was not the nomes that were birds or men, but the deities worshipped in them. Anz (perhaps from the Semitic 'az, "the strong one") meant "king," and represented the human Osiris.
fore, was not originally the ibis, and, in spite of his bird's head, the human body which he retained was a traditional evidence of the fact. He was merely "attached to the ibis,"—attached, that is to say, to the place where the ibis was the fetish of the aborigines.

According to Manetho, it was not until the reign of the second king of the Second Dynasty that Apis, Mnevis, and Mendes "were adjudged to be gods." This must mean that it was then that the State religion admitted for the first time that the official gods of Memphis, Heliopolis, and Mendes were incarnated in the sacred animals of the local cults. That the statement is historically correct, may be gathered from the fact that the temples of Memphis and Heliopolis were dedicated to Ptah and Tum, and not to Apis and Mnevis. When they were built the divinity of the bull had not yet been officially recognised. The gods in whose honour they were founded were gods of human form, and gods of human form they continued to be. Down to the last days of Egyptian paganism the sun-god of Heliopolis was not a bull, but a man; and though the mummified Apis watched over the cemeteries of Memphis, the god of its great temple remained a mummified man and not a mummified bull.

One of the legends elaborately concocted in the temples out of old folk-tales and etymological puns explained the animal forms of the gods as the result of the murder of Osiris by Typhon or Set. The fear of sharing his fate made them hide themselves, it was related, in the bodies of the beasts. But the explanation must belong to an age when the introduction of foreign ideas had thrown discredit on the old worship of animals. In earlier times no explanation was needed. The belief in the power possessed by the soul of migrating from one body into another, and the symbolism of which the hieroglyphic

1 Plutarch, De Iside et Osiride, ed. Leemans, lxxii. p. 126.
writing was at once the expression and the cause, formed an easy bridge by which the fetishism of neolithic Egypt and the anthropomorphism of historical Egypt could be joined together. Horus is a hawk and the Pharaoh is a bull on the earliest monuments we possess, and such visible symbols necessarily reacted on a people, one half at least of whom already acknowledged the hawk and the bull as their gods. The official recognition of Apis and Mnevis and Mendes was the last step in the process of incorporating the aboriginal superstitions and practices into the State religion, and giving them official sanction. The parallelism with Brahmanism in India is complete. But we have still to ask why it was that the bull was worshipped in one district of prehistoric Egypt, the hawk in another? Why was it that a particular fetish was the protecting deity of a particular sanctuary or nome? To this there can be but one answer. A modified form of totemism must once have been known in the valley of the Nile. The sacred animal must have been the last representative of the totem of the tribe or clan. The emblems borne on the flagstaffs of the prehistoric boats, like the emblems on the standards of the several nomes, must have been the animals or objects in which the clans saw the divine powers which held them together, and from which, it may be, they were derived. The subsequent history of animal worship in Egypt is a continuous drifting away from this primitive totemism. The inanimate objects first fall into the background; then, under the influence of a higher form of religion, the animals become symbols, and assume semi-human shapes, and finally one only out of a species is selected to become the incarnation of a god. But the god of whom he is the incarnation is a very different god from the divinity that was believed to reside in the original fetish. It is a god in the Asiatic and not in the African sense, a god
whose nature is spiritual and free from the limitations of our earthly existence, so that he can enter at any moment into whatsoever form he desires. The old fetishes survived, indeed, but it was as amulets and charms; and to these the multitude transferred its faith as the State religion became more and more unintelligible to it. The magic lock of hair and image of a serpent preserved at Saft el-Henna, and said by the priests to have belonged to the sun-god, had doubtless come down from the days of fetishism.

It has often been asserted that besides the bull or the ram or the crocodile, there were other creatures of a composite or fabulous character which were also accounted sacred by the Egyptians. It is true that the sacred animal and symbol of Set seems to be of this nature. His forked tail and ass-like ears make it difficult to believe that any existing beast ever served for his portrait. But the sphinx, in whom the men of the Eighteenth Dynasty saw the image of Harmakhis, the rising sun, or the phœnix in whom the sun-god of Heliopolis was incarnated, belongs to a different category. They are not sacred animals in the sense in which Apis and Mnevis were so.

The sphinx, like the symbol of Set, is one of those composite creatures which meet us from time to time in Egyptian art. It has been said that such composite creatures were as real to the Egyptian as the cattle and sheep he tended in the fields; that he was quite as much prepared to meet with them in the desert, as the ancient Greek would have been to meet with a satyr in the woods or a Highlander with a kelpie by the waterside. Very possibly that was the case; it will not, however, explain their origin, or the forms that were assigned to them. Why, for instance, should the sphinx of Giza be in the form of a lion with a human head?
Once more we must look to Asia for an explanation. The sphinx of Giza was the guardian of the tombs of the dead; it protected them from the spiritual foes whose home was in the desert. "I protect thy sepulchral chapel," it is made to say in an inscription, "I watch over thy sepulchral chamber, I keep away the stranger who would enter, I overthrow the foe with their weapons, I drive the wicked from thy tomb, I annihilate thy opponents... so that they return no more." ¹ The sphinx, in fact, performed precisely the same office as the winged bulls that guarded the entrance to an Assyrian palace, or the cherubim who stood at the gates of the garden of Eden.

The winged bulls and the cherubim were composite creatures, and came originally from Babylonia. Babylonia was the primal home, indeed, of all such animal combinations. They were painted on the walls of the temple of Bel at Babylon, and their existence formed an essential part of the Babylonian cosmogony. That cosmogony rested on the doctrine of a contest between the powers of light and darkness, of order and chaos, and on the final victory of the gods of light. There was a world of chaos as well as a world of order; and before the present creation could be evolved with its settled laws and definite boundaries, there had been of necessity another creation in which all things were confused and chaotic. The brood of Tiamat, the dragon of chaos, corresponded with the creatures of the actual world which the gods of light had called into existence; they were abortive attempts at creation, composed of limbs which matched not together, "men with the body of birds, or the faces of ravens."

This brood of chaos were the demons who were the enemies of Bel-Merodach and his followers. In order to

¹ Zeitschrift für Ägyptische Sprache (1880) p. 50.
oppose them successfully, it was needful that there should be similarly composite creatures, who, instead of being on the side of evil, were under the orders of the gods. By the side of the evil demon, therefore, there was the "good cherub," who protected the pious Babylonian, and barred the way to the spirits of wickedness. The winged bull with his human head defended the approach to a temple or house; men with the bodies of scorpions guarded the gateways of the sun.

This curious similarity in the functions assigned to the images of composite animals both in Egypt and Babylonia, raises the presumption that the composite forms themselves were ultimately derived from a Babylonian source. That such was the case we now have proof.

On the slate plaques and mace-heads of Nekhen and Abydos we find composite forms similar to those of Babylonia. What afterwards became the Hathor-headed column appears as a human face with a cow's ears and horns. Below are two monsters with a dog's body and a lion's head, whose intertwined necks are snakes. What makes the latter representation the more interesting is, that M. Heuzey has pointed out exactly the same figures on an early Babylonian seal now in the Louvre.1 Like the seal-cylinder, therefore, which distinguishes the early period of Egyptian history, the composite monsters of which the sphinx and the symbol of Set were surviving examples indicate direct communication with Chaldæa.

And, it must be remembered, it is only in Chaldæa that they find their explanation. Here they originated in the religious and cosmological ideas associated with the physical features of the country. The sphinx of

1 Rev. Archéologique, xxxiv. p. 291. On the seal-cylinder they are accompanied by the lion-headed eagle of primitive Babylonian art. The Egyptian figures are given in the Zeitschrift für Ägyptische Sprache, xxxvi. pl. xii.
Giza still guards the desert of Giza, because ages ago the flooding waves of the Persian Gulf made the Babylonians believe that the world had arisen out of a watery chaos peopled by unformed creatures of monstrous shape.

The case of the phoenix or _bennu_ is somewhat different. Here we have to do not with a fabulous monster, but with an existing bird of which a fabulous story was told. The bird was not an eagle, as Herodotos supposed, but a heron, which at an early date seems to have been confounded with the crested ibis, the symbol of the _khé_ or luminous soul. It was, in fact, the spirit of the sun-god, and later legends declared that it stood and sang on the top of a tree at Heliopolis, while a flame burst forth beside it, and the sun rose from the morning sky. With sunset it became an Osiris, whose mummy was interred at Heliopolis, to awake again to life with the first rays of the rising sun. It was thus for Christian writers an emblem of the resurrection, and as such its story is told by St. Clement of Rome:¹ "There is a certain bird which is called the phoenix. This is the only one of its kind, and it lives five hundred years. When the time of its dissolution draws near that it must die, it builds itself a nest of frankincense and myrrh and other spices, into which, when the time is fulfilled, it enters and dies. But as the flesh decays a certain kind of worm is produced, which, being nourished by the juices of the dead bird, brings forth feathers. Then, when it has acquired strength, it takes up the nest in which are the bones of its parent, and, bearing these, it passes from the land of Arabia into Egypt, to the city called Heliopolis. And, flying in open day in the sight of all men, it places them on the altar of the sun, and, having done this, it hastens back to its former abode. The priests then inspect the

¹ _Ep. ad Cor. 25._
chronological registers, and find that it has returned exactly when the five hundredth year is completed.¹

The legend of the phoenix has grown up round the belief that the disembodied soul could enter at will into the body of a bird. The phoenix was allied to the hawk of Horus, and probably was originally identical with that primitive symbol of the soul (khâ), the name of which means literally "the luminous." It will be remembered that the Pyramid texts speak of the "four khâ" or "luminous souls of Horus" "who live in Heliopolis," and the sun-god of that city was usually invoked by his bau or "souls," figured as three birds which appear as three ostriches on objects found in the tomb of Aha.² On an early seal-cylinder of Babylonian type the bennu or khâ is termed "the double of Horus."³

The story of the phoenix illustrates the influence exercised by the pictorial character of Egyptian writing upon the course of religious thought. The soul was first symbolised by a bird. It passed out of the corpse and into the air like a bird; it was free to enter whatever body it chose, and the body of a bird was that which it would naturally choose. Even today the belief is not extinct in Europe that the spirits of the dead pass into the forms of swallows or doves. But at first it was immaterial what bird was selected to express pictorially the idea of a soul. It was the ostrich when the latter still existed in Southern Egypt;

¹ See also Herodotos, ii. 73; Pliny, N. H. x. 2; Tertullian, De Resurr. 13.
² De Morgan, Recherches sur les Origines de l'Égypte, ii. p. 165.
³ Sayce, Proc. S.B.A., Feb. 1898, No. 8. On a monument discovered at Sân (Petrie, Tanis, pt. ii. pl. x. 170), we read of "Horus in the bennu as a black bull," "Horus in the bennu as a horned bull." The cemetery of Tanis was called "the city of the phoenix" (bennu). At Edfu it is said that the phoenix (bennu) "comes forth from the holy heart" of Osiris.
then it became the plover, in consequence, probably, of a similarity in sound between the name of the plover and that of the soul. At other times the favourite symbol was the crested ibis, whose name was identical with a word that signified "light." Around the conception of the soul there accordingly gathered associations with the light, and more especially with the light of the sun. The sun-god, too, had a double and a soul; what could be more fitting, therefore, than that they should be represented by the crested ibis? It was but a step farther to see in the bird an incarnation of the sun-god himself.

The subsequent development of the myth was due to the fact that the god of Heliopolis continued to be depicted as a man. His human form was too stereotyped in religious art to be changed, and the phoenix consequently was never actually identified with him. It was his soul, but it was not Ra himself. The combination of the man and the beast could be tolerated only when both were co-ordinate survivals from a distant past. The inner contradiction between the human and the bestial god was then obscured or ignored.

With the human god was closely connected the ancestor worship, which was quite as much a characteristic of Egypt as the worship of animals. It was due in the first instance, perhaps, to the belief that the $Ka$ of the dead man needed food and nourishment, and that if he did not receive them the hungry double would revenge himself on the living. To this day the Egyptian fellahin, both Moslem and Copt, visit the tombs of their forefathers at certain times in the year, and, after eating and drinking beside them, place a few grains of wheat or some similar offering on a shelf in front of a window-like opening into the tomb. But the belief in the material needs of the $Ka$ would not of itself have sufficed to support the long lines of priests who were
attached to the cult of the dead, or the prayers that were addressed to them. It was the deification of the Pharaoh which caused "prophets" of Khufu and Khafra to be still consecrated in the days of the Twenty-sixth Dynasty, and prevented the forms of the sacred animals from being pictured on the temple walls. As long as there was a human god on earth, there could also be a human god in heaven; and in the Pyramid texts of the Sixth Dynasty the dead Pepi or Teta is as much a god as any deity in the pantheon.

When the Osirian faith had spread throughout Egypt, and the pious Egyptian looked forward after death to becoming himself an "Osiris," there was still greater reason for the divine honours that were paid to the ancestor. In paying them to him the worshipper was paying them to the god of the dead. And the god of the dead was himself one of the ancestors of the Egyptian people. He was a human god who had once ruled on earth, and he still governed as a Pharaoh in the world beyond the grave. As the Pharaoh was a theomorphic man, so Osiris was an anthropomorphic god. In him the cult of the ancestor reached its fullest development.

It was natural that Pharaonic Egypt should have been, so far as we know, the birthplace of euhemerism. Where the gods had human forms, and the men were gods, it was inevitable that it should arise. The deification of the Pharaoh prevented any line being drawn between the living man and the deity he worshipped. As the man could be a god, so too could the god be a man. The gods of Egypt were accordingly transformed into Pharaohs, who lived and conquered and died like the Pharaohs of history. They differed from the men of to-

---

1 On a stela in the Louvre a certain Psamtik, son of Uza-Hor, calls himself prophet of Khufu, Khaf-Ra, and Dadef-Ra, as well as of Tanen, Isis, and Harmakhis.
day only in having lived long ago, and on that account being possessed of powers which are now lost. That they should have died did not make them less divine and immortal. The Pharaoh also died like the ancestors who were worshipped at the tombs, but death meant nothing more than passing into another form of existence. It was merely a re-birth under new conditions. The Ka continued as before; there was no change in outward shape or in the moral and intellectual powers.

In fact, the death of the god was a necessary accompaniment of an anthropomorphic form of religion. In Babylonia the temples of the gods were also their tombs, and even among the Greeks the sepulchre of Zeus was pointed out in Crete. The same cult was paid to the dead Naram-Sin or the dead Gudea in Chaldæa that was paid to the dead Khufu in Egypt. We have no need to seek in any peculiarly Egyptian beliefs an explanation of the ancestor worship which, along with the deification of the king, it shared with Babylonia.

The euhemerism of the Egyptian priesthood sounded the knell of the old faith. As the centuries passed, purer and higher ideas of the Godhead had grown up, and between the "formless" and eternal Creator of the world and the man who had become a god, the distance was too great to be spanned. On the one side, the gods of the national creed had been resolved one into another, till no distinctive shape or character was left to any one of them; on the other side, they had been transformed into mere human kings who had ruled over Egypt long ago. The pantheistic Creator and the deified Egyptians of vulgar and prosaic history could not be harmonised together. The multitude might be content with its sacred animals and its amulets, but the thinking portion of the nation turned to Greek metaphysics or a despairing scepticism. Already, in the time of the Eleventh
Dynasty, the poet who composed the dirge of king Antef gives pathetic expression to his doubts—

"What is fortune? say the wise.
Vanished are the hearths and homes,
What he does or thinks, who dies,
None to tell us comes.

Have thy heart's desire, be glad,
Use the ointment while you live;
Be in gold and linen clad,
Take what gods may give.

For the day shall come to each
When earth's voices sound no more;
Dead men hear no mourners' speech,
Tears can not restore.

1 The versification is Canon Rawnsley's, Notes for the Nile, pp. 188, 189. Professor Erman's literal translation is as follows (Life in Ancient Egypt, Eng. tr., pp. 386, 387)—

"I heard the words of Imhotep and Har-dad-ef,
Who both speak thus in their sayings:
'Behold the dwellings of those men, their walls fall down,
Their place is no more,
They are as though they had never existed.'
No one comes from thence to tell us what is become of them,
Who tells us how it goes with them, who nerves our hearts,
Until you yourselves approach the place whither they are gone.
With joyful heart forget not to glorify thyself
And follow thy heart's desire, so long as thou livest.
Put myrrh on thy head, clothe thyself in fine linen,
Anointing thyself with the marvellous things of God.
Adorn thyself as beautifully as thou canst,
And let not thy heart be discouraged.
Follow thy heart's desire and thy pleasures
As long as thou livest on earth.
Follow thy heart's desire and thy pleasures
Till there comes to thee the day of mourning.
Yet he, whose heart is at rest, hears not their complaint,
And he who lies in the tomb understands not their mourning.
With beaming face keep holiday to-day,
And rest not therein.
For none carries his goods away with him,
Yea, none returns again, who has journeyed thither."
Eat and drink in peace to-day,
    When you go, your goods remain;
He who fares the last long way
    Comes not back again."

Still more hopeless are the words put into the mouth of the wife of the high priest of Memphis at the close of the first century before our era—

"O my brother, my spouse, and my friend,
    High priest of Memphis!
Cease not to drink and to eat,
    To fill thyself with wine, and to make sweet love;
Enjoy each festive day and follow thy desire,
    Let not care enter thy heart
All the years that on earth thou remainest.
    The underworld is a land of thick darkness,
A sorrowful place for the dead.
    They sleep, after their guise, never to awaken
And behold their comrades.
    Their father and their mother they know not,
No yearning for their wives and their children do they feel." ¹

¹ Brugsch's translation (Die Aegyptologie, i. p. 163).
LECTURE VI.

THE GODS OF EGYPT.

In the language of ancient Egypt the word neter signified "a god." Sir P. le Page Renouf endeavoured to show that the word originally meant "strong," and that the first Egyptians accordingly pictured their gods as embodiments of strength. But it has been pointed out that where neter is used in the sense of "strong," it is rather the lustiness of youth that is meant, and that a better rendering would be "fresh and vigorous." The verb neter signifies "to flourish" and "grow up." Moreover, it is a question whether between this verb and the word for "god" there is any connection at all. It is difficult to understand how the gods could be described as "growths" unless they were conceived of as plants; and of this there is no evidence in ancient Egypt. We must be content with the fact that as far back as we can trace the history of the word neter, it meant "god" and "god" only.

But we must also beware of supposing that the Egyptians attached the same ideas to it that we do, or that it had the same connotation at all periods of their history or among all classes of the people. The pantheistic deity of Khu-n-Aten was a very different being from the sun-god of whom the Pharaohs of the Fifth Dynasty had called themselves the sons, and between

1 Hibbert Lectures on the Religion of Ancient Egypt (1879), pp. 93-100.
2 Brugsch, Die Aegyptologie, p. 167.
the divinity which the multitude saw in the bull Apis and the formless and ever-living Creator of the priesthood there was a gulf which could hardly be bridged. But even the conception of the Creator formed by the priesthood is difficult for us to realise. Eighteen centuries of Christianity have left their impress upon us, and we start from a different background of ideas from that of the Egyptian, to whatever class he may have belonged. It is impossible that we can enter exactly into what the Egyptian meant by such expressions as "living for ever" or "having no form"; even the words "life" and "form" would not have had the same connotation for him that they have for us. All that we can do is to approximate to the meaning that he gave to them, remembering that our translation of them into the language of to-day can be approximative only.

The hieroglyphic writing which preserved memories of a time that the Egyptians themselves had forgotten, represents the idea of a "god" by the picture of an axe. The axe seems originally to have consisted of a sharpened flint or blade of metal hafted in a wooden handle, which was occasionally wrapped in strips of red, white, and black cloth.\(^1\) It takes us back to an age of fetishism, when inanimate objects were looked upon as divine, and perhaps reflects the impression made upon the natives of the country by the Pharaonic Egyptians with their weapons of metal. Horus of Edfu, it will be remembered, was served by smiths, and the shrines he founded to commemorate his conquest of Egypt were known as "the smithies." The double-headed axe was a divine symbol in Asia Minor,\(^2\)

\(^1\) See Beni-Hasan, pt. iii. (Archæological Survey of Egypt), pl. v. fig. 75.

\(^2\) The double-headed axe is carved repeatedly on the walls of the "palace of Minos," discovered by Dr. A. J. Evans at Knossos, and seems to have been the divine symbol which was believed to protect the building from injury. On the coins of Tarsus the sun-god Sandan carries an axe.
and both in the old world and in the new the fetish was wrapped in cloths. Even at Delphi a sacred stone was enveloped in wool on days of festival.

In the sacred axe, therefore, which denoted a god, we may see a parallel to the standards on the prow of the prehistoric boat or to the symbols of the nomes. It would have represented the gods of those invaders of the valley of the Nile who brought with them weapons of copper, and have been the symbol of the conquering race and the deities it worshipped. As the Pharaonic Egyptians appropriated the fetishes of the older population in their sculptures and their picture-writing, so too would they have appropriated what had become to the neolithic people the sign and emblem of superior power.

We have already dealt with an important class of gods, those which had a solar origin. There were other gods of an elemental character, whose worship does not seem to have been originally confined to one particular locality. Such were Seb, the earth, Nut, the sky, and Nu, the primeval deep. But they played only a small part in the religion of the country. Seb was known in later days chiefly as the father of Osiris; at an earlier epoch he had been the rpā, or "hereditary prince, of the gods," a title which takes us back to the feudal period of Egypt, when as yet there was no Pharaoh who ruled over the whole of the land. The animal sacred to him was the goose, perhaps on account of some similarity in its name; but he was never identified with it, and continued to the last to be depicted in human form. His symbol, however, gave rise to a cosmological myth. The goose became the mother of the egg out of which the universe was born.

Nut was the wife of Seb, wedded to him as the sky is wedded to the earth. It seems reasonable to see in her the feminine form of Nu, the primeval chaos of waters; and so the Egyptians of the historical period believed,
since they identified her with the wife of the Nile, and represented her as sitting in the sycamore and pouring the water of life on the hands of a soul at the foot of the tree. It has been suggested, however, that Nu was of later origin than Nut, who became a Nile goddess with the head of a snake only when Nu himself had been changed into the Nile.¹ But the idea of a watery chaos is not one which would have grown up on Egyptian soil. There it was rather the desert which represented the unformed beginning of things; the Nile spread itself over the already existing land at regular intervals, and was no dreary waste of waters, out of which the earth emerged for the first time. The geographical home of the idea was in Babylonia, on the shores of the ever-retreating Persian Gulf. And from Babylonia we find that the belief in a primeval deep spread itself over Western Asia. The Egyptian Nu is the counterpart of the Babylonian Mummu, the mother of gods, as Nu was their father. Professor Hommel may even be right in identifying the name with the Babylonian Nun or Nunu, the lord of the deep.

But Nu survived only in the theological schools, more especially in that of Hermopolis, the modern Eshmunên. The god of Hermopolis was Thoth, the Egyptian Dehuti. Thoth seems to have been at the outset the moon, which was thus, as in Babylonia, of the male sex. A legend, repeated by Plutarch,² relates how he gained the five intercalatory days of the Egyptian year by playing at dice with the moon; and he was at times identified with the moon-gods Aah and Khonsu. The first month of the year was his, and he was the measurer of time, who had invented arithmetic and geometry, music and astronomy, architecture and letters. He knew the magic formulæ which could bind the gods themselves, and as

¹ See above, p. 83. ² De Isid. 12.
minister of the Pharaoh Thamos had introduced writing and literature into Egypt. Henceforward he remained the patron of books and education, on which the culture of Egypt so largely rested. He was, in fact, the culture-god of the Egyptians to whom the elements of civilisation were due.

It is curious that we do not know his true name, for Dehuti means merely the god "who is attached to the ibis." Was it really Nu? and is Thoth really a compound of a moon-god and a sun-god? At all events the culture-god of Babylonia who corresponded to Thoth was Ea, the deep, and one of the earliest names of Ea was "the god Nun." Moreover, the son of Ea was Asari, the Osiris of Egypt; and just as Asari instructed mankind in the wisdom and laws of Ea, so Thoth acted as the minister of Osiris and adjudged his cause against Seb. Like Ea, too, Thoth wrote the first books from which men derived their laws.¹

However this may be, Thoth was the creator of the world through the word of his mouth. In the cosmogony of Hermopolis the universe and the gods that direct it are the creation of his word, which later ages refined into the sound of his voice. From Hermopolis the doctrine passed to other parts of Egypt, and under the Theban dynasties tended to displace or absorb the older Heliopolitan doctrine of creation by generation. But the doctrine was known also in Babylonia, where the god whose word is creative was Asari, the Merodach of the Semites. In the Babylonian Epic of the Creation the "word" of Merodach creates and destroys, like the "word" of Yahweh in the Old Testament. I must leave to another lecture the consideration as to how far the

¹ As Thoth writes the name of the king upon the sacred sycamore in order to ensure him everlasting life, so the name of Ea is written upon the core of the sacred cedar-tree (W.A.I. iv. 15, Rev. 10–13); Sayce, Hibbert Lectures on the Religion of the Ancient Babylonians, p. 240.
Logos of Alexandrine philosophy has been influenced by the theology of Hermopolis.

Whether Thoth were originally Nu or not, Nu at all events forms the second member of the Hermopolitan Ennead. Professor Maspero has shown that it was modelled on the Ennead of Heliopolis. But in accordance with the more abstract character of the cosmogony of which it was a part, the divinities of which it is composed are abstractions that look strangely out of place in the Egyptian Pantheon.

Nu is provided with the feminine Nut, who is not to be confounded with the old goddess of the sky, and from them are derived the successive pairs Hehui and Hehêt, Kek and Keket, Nini and Ninit, "eternity," "darkness," and "inertia." The whole scheme is Asiatic rather than Egyptian, but the gods composing it are already mentioned in the Pyramid texts.

The four pairs of abstract deities constituted "the eight" gods after whom Hermopolis received one of its names (Khmunu, now Ashmunêh), and who were often addressed as "the god eight," like "the god seven" in Babylonia. Professor Maspero sees in them a philosophical development of the four cynocephalous apes who accompanied Thoth and saluted the first streak of dawn. But the development is difficult to follow, and the apes who are the companions of the god probably had another origin. They certainly must have come from the Sudân; no apes were indigenous in Egypt in historical times. Moreover, it was only the Thoth of Hermopolis in Upper Egypt in whose train they were found; the Thoth of Hermopolis Parva in the

---

1 Études de Mythologie et d'Archéologie égyptiennes, ii. pp. 331-335.
2 This is Brugsch's translation (Religion und Mythologie der alten Aegypter, p. 123 sqq.); but the meaning of the last name is doubtful, and the first is rather "time" than "eternity."
Delta, properly speaking, knew them not. But from an early epoch "the five gods"—Thoth and his four ape-followers, whose likeness he sometimes adopted—had been worshipped at Eshmunê. Its temple was called "the Abode of the Five," and its high priest "the great one of the House of the Five."¹

How the half-human apes of Central Africa came to be associated with Thoth we do not know. Between the baboons who sing hymns to the rising and setting sun and the moon, or the culture-god, there is little or no connection. But a curious biography found in a tomb at Assuan throws light upon it. Herkhuf, the subject of the biography, was sent by Hor-em-saf of the Sixth Dynasty on an exploring expedition into the Libyan desert south of the First Cataract, and he brought back with him a Danga dwarf "who danced the dances of the god," like another Danga dwarf brought from Punt in the neighbourhood of Suâkim or Massawa in the time of the Fifth Dynasty. The dwarf was evidently regarded by Herkhuf as a species of baboon, if we may judge from the account he gives of the way in which he was treated; even to-day the ape in the zoological gardens of Giza is called by the lower classes at Cairo "the savage man." Travellers have described the dancing and screaming of troops of apes at daybreak when the sun first lights up the earth, and it was natural for primitive man to suppose that the dancing was in honour of the return of the god of day. Dances in honour of the gods have been common all over the world; indeed, among barbarous

¹ See Maspero, Études de Mythologie et d'Archéologie, ii. pp. 257 sqq. and 375 sqq. In an inscription discovered by Professor Petrie in the tombs of the first two dynasties at Abydos, Thoth is represented as a seated ape (The Royal Tombs of Abydos, pt. i. pl. xvii. 26). On the other hand, on the broken Abydos slate figured in de Morgan, Recherches sur les Origines de l'Égypte, pl. ii., which is probably prehistoric, Thoth appears as an ibis.
and savage peoples the dance is essentially of a religious character. Even David danced before the ark, and boys still dance before the high altar in the cathedral of Seville. That dances are represented on the prehistoric pottery of Egypt, has been pointed out by M. de Morgan; and since the Danga dwarf came from the half-mythical country in the south which was known to the Egyptians as "the land of the gods," and where, too, the apes of Thoth had their home, it was reasonable to believe that he knew the dance that would be pleasing to the gods.

I believe, therefore, that the apes of Thoth were at the outset the dwarf-like apes or ape-like dwarfs who danced in his honour in the temple of Hermopolis. Gradually they were taken hold of by that symbolism which was inseparable from a religion so intimately bound up with a pictorial system of writing; from dancers they became the followers of the god, who sang to the rising and setting sun the hymns which Thoth had composed. But this would have been when the worship of the sun-god of Heliopolis had already spread to Hermopolis, and the cult of Thoth was mingling with that of Ra. The mutual influence of the theories of creation taught by the priests of the two cities shows at what a comparatively early date this would have happened.

It is possible that there was actually a connection between the four baboons and the four elemental gods of Hermopolitan theology. But it was not in the way of development. It was rather that as the gods were four in number, the dancers in their temple were four also. To each god, as it were, an ape was assigned.

The influence of Hermopolis belongs to the pre-Menic age of Egypt; we can hardly any longer call it prehistoric. So, too, does the influence of Nekhen, once

2 Maspero, Études de Mythologie et d’Archéologie, p. 429 sqq.
the capital of the kingdom of Upper Egypt. In a former lecture I have already spoken of its vulture-headed goddess Nekhbit, the consort of the hawk Horus, whose temple at El-Kab guarded the outlet of the road from the Red Sea, and who was known as Mut, "the mother," at Thebes. She was, in fact, the goddess of all Upper Egypt, whose worship had spread over it in the days when Nekhen was its ruling city. The gods of the Pharaoh followed the extension of his power.

In the early inscriptions of the First Cataract the vulture-headed goddess sitting on her basket is identified with the local divinity Sati (more correctly Suti), "the Asiatic." From her the island of Sehel received its name, and there her sanctuary stood before Isis of Philae ousted her from her supremacy. She was symbolised by the arrow, the name of which was the same as that of the goddess, and which was, moreover, a fitting emblem of the hostile tribes of the desert. It already appears on the prehistoric pottery as a sacred fetish on the "flagstaff" or standard at the prow of the boat.

The name of Sati, or rather Suti, is remarkable. It was not only the name of the goddess of the First Cataract, it was also the name given by the Egyptians to the nomadic tribes of Asia. But it was not the Egyptians only who used it in this sense. From time immemorial the name Sutê had precisely the same meaning among the Babylonians. The fact cannot be accidental; and as Sutê is of Babylonian origin, we have in it a fresh proof of the relations of the Pharaonic Egyptians with primeval Babylonia.

But the goddess Sati does not stand alone. There was also a god Set (or Sut), the twin-brother and enemy of Osiris, and, like Esau in Hebrew history, a representative of the desert; while at the Cataract another goddess, Ênuqet by name, is her companion. Now Ênuqet is the
feminine of Anuq, the Anaq of the Old Testament. The foreign nature of Anuqet has long been recognised, for she wears on her head the non-Egyptian head-dress of a cap fringed with feathers. It is the same head-dress as that worn by the god Bes, whom the Egyptians derived from the land of Punt on the shores of the Red Sea. A similar cap is worn by the Zakkal on the coast of Palestine, in the near neighbourhood of "the sons of Anaq," as well as by the Babylonian king Merodach-nadin-akhi, on a monument now in the British Museum. 1 Everything, therefore, points to its having been an Asiatic characteristic; perhaps it was made of the ostrich feathers which are still collected in Arabia and even on the eastern side of the Jordan.

The Greeks identified Anuqet with Hestia, and Sati with Héra. This was probably because Sati was the wife of Khnum (or Kneph), the god of the Cataract. As such Sati was also known as Heket, "the frog," which was supposed to be born from the mud left by the inundation of the Nile. It thus became a symbol of the resurrection, and was consequently adopted by the Christians of Egypt. Hence the frequency with which it is represented on lamps of the late Roman period.

Khnum, like the god of Thebes, was a ram, and is accordingly usually depicted with a ram's head. But he could not originally have been so. Once more the old fetish of the district, the sacred animal of the nome, must have been fused with the god whom the Pharaonic invaders brought with them. For Khnum was a potter, as his name signifies, and at Philæ it is said of him that he was "the moulder (khnum) of men, the modeller of

1 The same cap is worn by the god who sits behind a scorpion-man on a stone containing a grant of land by the Babylonian king Nebuchadrezzar I. (B.C. 1100). The stone was found at Abu-Habba, and is now in the British Museum (Wal. v. 57).
the gods.” Hence he is called “the creator of all this, the fashioner of that which exists, the father of fathers, the mother of mothers,” “the creator of the heaven and the earth, the lower world, the water and the mountains,” “who has formed the male and female of fowl and fish, wild beasts, cattle, and creeping things.”

In Babylonia, Ea, the culture-god and creator, was also termed the “potter,” and it was thus that he moulded the gods as well as men. At the same time, like Khnum, he was a god of the waters. While the Cataract of the Nile was the home of Khnum, the Persian Gulf was the dwelling-place of Ea. The connection between the water and the modeller in clay is obvious. It is only where the water inundates the soil and leaves the moist clay behind it that the art of the potter can flourish.

But was there also a connection between the Babylonian god who was worshipped in the ancient seaport of Chaldaea and the god of the Egyptian Cataract? We have seen that the wife of Khnum was entitled “the Asiatic,” the very form of the name being Babylonian. We have further seen that her companion Anuqet was also

1 Maspero (Dawn of Civilisation, p. 157) reproduces a picture in the temple of Luxor representing Khnum moulding Amon-hotep III. and his Ka on a potter’s table.
3 The khnum or “pot” is often used to express the name of Khnum in the hieroglyphics. It reminds us of the vase on early Babylonian seal-cylinders from the two sides of which flow the rivers Tigris and Euphrates, and which is often held in the hands of the water-god Ea. The design is reproduced with modifications on early Syrian cylinders, and the name of the zodiacal sign Aquarius shows to what an antiquity it must reach back. The primitive Egyptians believed that the Nile issued from a grotto from which the qerti or “two gulfs” of the Cataract gave access (Maspero, Dawn of Civilisation, pp. 19, 38, 39), and Khnum was the god of the Cataract. Perhaps the classical representation of the Tiber and other rivers holding urns from which a stream of water flows is derived from Egypt.
from Asia, and that her traditional head-dress preserved a memory of the fact. There is a road from the Red Sea to Assuan as well as to El-Kab; it may be that it goes back to those prehistoric times when the Pharaonic Egyptians made their way across the desert into the valley of the Nile, as their Semitic kinsfolk did in later days into the tablelands of Abyssinia.

The creator who was worshipped at Memphis, at the other end of the Nile valley, was a potter also.\(^1\) This was Ptah, whose name is derived from a root which means to “open.” According to Porphyry, he had sprung from an egg which had come from the mouth of Kneph. But the reference in the name is probably to the ceremony of “opening the mouth” of a mummy, or the statue of the dead man with a chisel, a finger, or some red pebbles, in order to confer upon it the capability of receiving the breath of life, and of harbouring the double or the soul.\(^2\) Ptah was represented as a mummy; he was, in fact, one of the gods of the underworld, who, like Osiris or the mummified Horus of Nekhen, had their tombs as well as their temples. He must have been the creative potter, however, before he became a mummy. Perhaps his transformation dates from the period of his fusion with Sokaris, who seems to have been the god of the cemetery of Memphis.\(^3\) At any rate, Ptah and

---

\(^1\) Men-nofer (Memphis), “the good place,” is the equivalent of the name of the ancient seaport of Babylonia, Eridu, the Sumerian Eri-duga or “good city.” Ea, the culture-god and creator, was the god of Eridu. In the Deluge tablet (l. 9) Ea says that he had not “opened (patû) the oracle of the great gods.” It is hardly worth while to mention that the antiquity of Memphis has been disputed by some philologists.

\(^2\) Ptah is stated in the Book of the Dead to have been the original author of the ceremony which he first performed on the dead gods.

\(^3\) This is Maspero’s view (Études de Mythologie et d’Archéologie, ii. pp. 21, 22). Wiedemann (Religion der alien Ägypter, p. 75) makes Sokaris a sun-god; but his solar attributes belong to the time when he was identified with Ra of Heliopolis.
Khnum are alike forms of the same primitive deity, and the names they bear are epithets merely. At Philæ, Ptah is pictured as about to model man out of a lump of clay, and the Khnumu, or “creators” who helped him to fashion the world, were his children.¹

The Khnumu are the Pataeki of Herodotos (iii. 37), whose figures, the Greek writer tells us, were carved by the Phoenicians on the prows of their vessels, probably to ward off the evil eye. They were dwarfs, like the Danga dwarf of Herkhuf or the god Bes, with thick heads, bowed legs, long arms, and bushy beards; and their terra-cotta figures have often been met with in the tombs. From the name Pataeki we might infer that they had been borrowed by the Phoenicians from Egypt. But it is also possible that both Egypt and Phoenicia derived them from the same source. Dr. Scheil has pointed out that a similar figure occurs on early Babylonian seal-cylinders, where its Sumerian name is given as “the god Nugidda” or “the Dwarf,” and it is sometimes represented as dancing before the goddess Istar.² Thus far, however, no text has been discovered which associates the god Nugidda with the creator of the world.

When Memphis became the capital of Egypt and the seat of the Pharaoh, its god also became supreme in the Egyptian pantheon. But he was no longer Ptah the creator simply. He was already amalgamated with Sokaris, and probably with Osiris as well. It was not difficult to identify two mummified gods whose domain was among the dead. With the spread of the sun-worship of Heliopolis and the spirit of pantheistic syncretism which accompanied it, the individuality of the old god of Memphis became still further lost. He was

¹ It was only when the sun-god had absorbed the other deities that they became the children of Ra.

² Recueil de Travaux, xix. pp. 50, 54.
merged into Tanen or Tatunen, a local god of the earth, as well as into Ra. He had already been made into the chief of an Ennead, and now the Ennead was resolved into a trinity. Nofer-Tum, "beautified by Tum," was brought from Heliopolis, and was made into a son of Ptah, afterwards to be superseded, however, by another abstraction, Im-hotep, "he who comes in peace." Im-hotep was reputed the first kher-heb or hierophant; he it was who recited and interpreted the liturgy of the dead and the magic formulae which restored health to the sick and raised the dead to life. The Greeks consequently identified him with Asklepios. Both Im-hotep and Nofer-Tum were the sons of Sekhet, the lion-headed goddess of Letopolis, from whence she must have been borrowed by the Memphite priests when the ancient potter god had become a generator, and a wife was needed for him.

With the decline of the Memphite dynasties and the fall of the Old Empire, the commanding part played by Ptah in the Egyptian pantheon was at an end. The god of the imperial city had been identified with the gods of the provincial nomes; his temple at Memphis had taken precedence of all others, and the local priesthoods were content that their deities should have found a shelter in it as forms of Ptah. He was even identified with Hâpi, the Nile, though perhaps the similarity in sound between the sacred name of the river and that of the bull Apis (Hapi) may have assisted in the identification.

1 To "come in peace" is still a common expression in Egyptian Arabic, and means "to return safely." The name seems to be taken from the office of Im-hotep, which was to conduct the dead safely back to a second life.

2 Nofer-Tum and Im-hotep had human forms like their father. The first is a man with a lotus flower on the head, the second a youth with a papyrus roll on the knee.

3 There was a difference only in the vowel of the first syllable.
That the Nile should have been worshipped throughout the land of Egypt is natural. The very land itself was his gift, the crops that grew upon it and the population it supported all depended upon his bounty. When the Nile failed, the people starved; when the Nile was full, Egypt was a land of contentment and plenty. It is only wonderful that the cult of the Nile should not have been more prominent than it was. The temples built in its honour were neither numerous nor important, nor were its priests endowed as the priests of other gods. But the cause of this is explained by history. The neolithic population of the country lived in the desert; the Nile was for them little more than the creator of pestilential swamps and dangerous jungles, where wild beasts and venomous serpents lurked for the intruder. The Pharaonic Egyptians brought their own gods with them, and these naturally became the divinities of the nomes. When the river had been embanked and its waters been made a blessing instead of a curse, the sacred animals and the gods of the nomes were too firmly established to be displaced.¹

But the backwardness of the State religion was made up for by the piety of individuals. Hymns to the Nile, like those which were engraved on the rocks of Silsilis by Meneptah and Ramses iii., breathe a spirit of gratitude and devotion which can hardly be exceeded—

"Hail to thee, O Nile!
who manifestest thyself over this land,

¹ The Nile-gods, representing the Nile and the canals, are depicted as stout men with large breasts, crowned with flowers, and wearing only the narrow girdle of prehistoric Egypt. The human form agrees well with the fact that the Nile was first engineered, and so made a source of life for Egypt, by the Pharaonic Egyptians. Babylonia was the country, it must be remembered, where river engineering and irrigation were originally developed.
and comest to give life to Egypt!
Mysterious is thy issuing forth from darkness,
on this day whereon it is celebrated!
Watering the orchards created by Ra
to cause all cattle to drink,
thou givest the earth to drink, inexhaustible one!...
Lord of the fish, during the inundation,
o
no bird alights on the crops.
Thou createst the wheat, thou bringest forth the barley,
assuring perpetuity to the temples.
If thou ceasest thy toil and thy work,
thou ceasest thy toil and thy work,
then all that exists is in anguish.
If the gods suffer in heaven,
thou givest the earth to drink, inexhaustible one!
No dwelling (is there) which may contain thee!
None penetrates within thy heart!
Thy young men, thy children, applaud thee
and render unto thee royal homage.
Stable are thy decrees for Egypt
before thy servants of the north.
He dries the tears from all eyes,
and guards the increase of his good things...
Establisher of justice, mankind desires thee,
suppli<wbr>cat<u><br/>ing thee to answer their prayers;
thou answerest them by the inundation!
Men offer thee the first-fruits of corn;
all the gods adore thee!...
A festal song is raised for thee on the harp,
with the accompaniment of the hand.
Thy young men and thy children acclaim thee,
and prepare their exercises.
Thou art the august ornament of the earth,
le<u><br/>tting thy bark advance before men,
lifting up the heart of women in labour,
and loving the multitude of the flocks.
When thou shinest in the royal city,
the rich man is sated with good things,
even the poor man disdains the lotus;
all that is produced is of the choicest;
all plants exist for thy children.
If thou refusest nourishment,
the dwelling is silent, devoid of all that is good,
THE GODS OF EGYPT

the country falls exhausted.
O Nile, come (and) prosper!
O thou that makest men to live through his flocks,
and his flocks through his orchards!" ¹

The supremacy of Memphis was replaced by that of Thebes, and under the Theban dynasties, accordingly, Amon, the god of Thebes, became paramount in the State religion of Egypt. But before we trace the history of his rise to supremacy, it is necessary to say a few words regarding the Egyptian goddesses. The woman occupied an important position in the Egyptian household; purity of blood was traced through her, and she even sat on the throne of the Pharaohs. The divine family naturally corresponded to the family on earth. The Egyptian goddess was not always a pale reflection of the god, like the Semitic consort of Baal; on the contrary, there were goddesses of nomes as well as gods of nomes, and the nome-goddess was on precisely the same footing as the nome-god. Nit of Sais or Hathor of Dendera differed in no way, so far as their divine powers were concerned, from Ptah of Memphis or Khnum of the Cataract. Like the gods, too, they became the heads of Enneads, or were embodied in Trinities, when first the doctrine of the Ennead, and then that of the Trinity, made its way through the theological schools. They are each even called "the father of fathers" as well as "the mother of mothers," and take the place of Tum as the creators of heaven and earth.²

Nit rose to eminence with the Twenty-sixth Dynasty. Her city of Sais had previously played no part in history, but both its goddess and its sanctuary were of old

¹ "Hymn to the Nile," translated by P. Guieysse, Records of the Past, new series, iii. p. 46 sqq. The hymn was composed by Anna or Annana in the time of Menepthah II.
² Brugsch, Religion und Mythologie, pp. 3, 248, 348.
date. Of the nature of the goddess, however, we know little. She is represented as a woman with a shuttle as her emblem, and in her hands she carries a bow and arrow, like Istar of Assyria or Artemis of Greece. But the twin arrow was also a symbol of the nome, which was a border district, exposed to the attacks of the Libyan tribes. The Greeks identified her with their Athéna on account of a slight similarity in the names.

Sekhet, or Bast of Bubastis, is better known. Sometimes she has the head of a lion, sometimes of a cat. At Philæ it is said of her that "she is savage as Sekhet and mild as Bast." But the lion must have preceded the cat. The earlier inhabitants of the valley of the Nile were acquainted with the lion; the cat seems to have been introduced from Nubia in the age of the Eleventh Dynasty. In the time of the Old Empire there was no cat-headed deity, for there were no cats. But the cat, when once introduced, was from the outset a sacred animal. The lion of Sekhet was transformed into a cat; and as the centuries passed, the petted and domesticated animal was the object of a worship that became fanatical. Herodotos maintains that when a house took fire the Egyptians of his time thought only of preserving the cats; and to this day the cat is

---

1 Her name is already mentioned in the Pyramid texts, and in Pepi ii. 131 she is described as the eye of Horus and "the opener of the paths," the ordinary title of Anubis as god of the dead.

2 In the Speos Artemidos near Beni-Hassan, where a large cemetery of mummified cats has been found, she is called Pakht, an older form of Bast.

3 On a slab discovered by Professor Petrie at Koptos, Usertesen i. of the Twelfth Dynasty already appears standing before a cat-headed goddess who is called "Bast, the lady of Shel." Shel is perhaps Ashel at Karnak, where the temple of Mut stood, in which so many figures of Bast or Sekhet have been found (Petrie, Koptos, pl. x. 2). The name of Bast also occurs in the Pyramid texts (Pepi 290); but here it is an epithet of Uazit, the goddess of Dep or Buto, once the capital of the kingdom of Northern Egypt, who is contrasted with the goddess of Nekheb.
honoured above all other animals on the banks of the Nile. The chief sanctuary of Bast was at Bubastis, where, however, the excavations of Dr. Naville have shown that she did not become the chief divinity before the rise of the Twenty-second Dynasty.¹

The goddesses passed one into the other even more readily than the gods. Sekhet developed by turns into Uazit and Mut, Selk the scorpion, and Hathor of Dendera. Pepi I, even at Bubastis, still calls himself the son of Hathor.

Hathor played much the same part among the goddesses that Ra played among the gods. She gradually absorbed the other female divinities of Egypt. They were resolved into forms of her, as the gods were resolved into forms of Ra. The kings of the Sixth Dynasty called themselves her sons, just as they also called themselves sons of the sun-god. She presided over the underworld; she presided also over love and pleasure. The seven goddesses, who, like fairy godmothers, bestowed all good things on the newborn child, were called by her name, and she was even identified with Mut, the starry sky. Her chief sanctuary was at Dendera, founded in the first days of the Pharaonic conquest of Egypt. Here she was supreme; even Horus the elder and the younger,² when compelled to form with her a trinity, remained lay figures and nothing more.

She was pictured sometimes as a cow, sometimes as a woman with the head of a cow bearing the solar disc between her horns: for from the earliest days she was associated with the sun. Sometimes she is addressed as the daughter of Ra;³ sometimes the sun-god is her son.

¹ Naville, Bubastis (Egypt Exploration Fund), i. pp. 44, 47, 48.
² Horus Ahi. The meaning of Ahi, the local title assigned to Horus the younger, is doubtful.
³ Thus at Dendera we read: "Ancestral mother of the gods, thou unitest thyself with thy father Ra in thy festal chamber."
At Dendera the solar orb is represented as rising from her lap, while its rays encircle her head, which rests upon Bâkhu, the mountain of the sun. In another chamber of the same temple we see her united with her son Horus as a hawk with a woman's head in the very middle of the solar disc, which slowly rises from the eastern hills. When Isis is figured as a cow, it is because she is regarded as a form of Hathor.¹

The original character of Hathor has been a matter of dispute. Some scholars have made her originally the sky or space generally, others have called her the goddess of light, while she has even been identified with the moon. In the legend of the destruction of mankind by Ra, she appears as the eye of the sun-god who plies her work at night; and a text at Dendera speaks of her as "resting on her throne in the place for beholding the sun's disc, when the bright one unites with the bright one." In any case she is closely connected with the rising sun, whose first rays surround her head.

Egyptian tradition maintained that she had come from the land of Punt, from those shores of Arabia and the opposite African coast from which the Pharaonic immigrants had made their way to the valley of the Nile. She was, moreover, the goddess of the Semitic nomads of the Sinaitic Peninsula; in other words, she was here identified with the Ashtoreth or Istar of the Semitic world.² Now the name of Hathor does not seem to be Egyptian. It is written with the help of a sort of rebus, so common in ideographic forms of writing.

¹ The so-called Hathor head with the horns of a cow is already found on the slate plaque of Kom el-Ahmar, which is either of the time of the First Dynasty or pre-Menie (Zeits. f. Aegypt. Spr. xxxvi. pl. xii.). A head of similar type is engraved under the name of Pepi II., discovered at Koptos (Petrie, Koptos, pl. v. 7).

² Horus and Hathor, that is to say, Baal and Ashtoreth, were, according to the Egyptians, the deities of Mafket, the Sinaitic Peninsula.
The pronunciation of the name is given by means of ideographs, the significations of which have nothing in common with it, though the sounds of the words they express approximate to its pronunciation. The name of Hathor, accordingly, is denoted by writing the hawk of Horus inside the picture of a "house," the name of which was Hât. A similar method of representing names is frequent in the ideographic script of ancient Babylonia; thus the name of Asari, the Egyptian Osiris, is expressed by placing the picture of an eye (šī) inside that of a place (ērī).

The name of Hathor, therefore, had primitively nothing to do with either Horus or the house of Horus, whatever may have been the speculations which the priests of a later day founded upon the written form of the name. It was only an attempt, similar to those common in the early script of Babylonia, to represent the pronunciation of a name which had no meaning in the Egyptian language. But it is a name which we meet with in the ancient inscriptions of Southern Arabia. There it appears as the name of the god Atthar. But Atthar itself was borrowed from Babylonia. It is the name of the Babylonian goddess Istar, originally the morning and evening stars, who, an astronomical text tells us, was at once male and female. As a male god she was adored in South Arabia and Moab; as the goddess of love and war she was the chief goddess of Babylonia, the patron of the Assyrian kings, and the Ashtoreth of Canaan. When, with the progress of astronomical knowledge, the morning and evening stars were distinguished from one another, in one part of Western Asia she remained identified with the one, in another part with the other.

Hathor is then, I believe, the Istar of the Babylonians. She agrees with Istar both in name and in attributes. The form of the name can be traced back to that of
Istar through the Atthar of South Arabia, that very land of Punt from which Hathor was said to have come. In Egypt as in Babylonia she was the goddess of love and joy, and her relation to the sun can be explained naturally if she were at the outset the morning star. Even her animal form connects her with Chaldæa. Dr. Scheil has published a Babylonian seal of the age of Abraham, on which the cow, giving milk to a calf, appears as the symbol of Istar, and a hymn of the time of Assur-bani-pal identifies the goddess with a cow.

I have left myself but little time in which to speak of the gods who interpenetrated and transfigured Egyptian theology in the period of which we know most. These are the gods of Thebes. For centuries Thebes was the dominant centre of a powerful and united Egypt, and its chief god Amon followed the fortunes of his city.

As the word amon meant "to conceal," the priests discovered in the god an embodiment of a mysterious and hidden force which pervades and controls the universe, and of which the sun is as it were the material organ. But such discoveries were the product of a later day, when the true meaning of the name had been long since forgotten, and Theban theology had become pantheistic. What Amon really signified the priests did not know, nor are we any wiser.

Amon was, however, the local god of Thebes, or rather of Karnak, and he seems from the first to have been a sun-god. But he had a rival in the warrior deity Mentu

---

1 It must be remembered that in Egypt the place occupied by the morning star in the astronomy and myths of other peoples was taken by Sirius on account of its importance for the rising of the Nile. And Sirius was identified with Isis.

2 Recueil de Travaux, xx. p. 62. Dr. Scheil further points out that the sacred bark of Bau, with whom Istar is identified, was called "the ship of the holy cow." At Dendera also, Isis, in her bark as goddess of the star Sirius, becomes Hathor under the form of a cow.
of Hermonthis, who also probably represented the sun. At any rate, Mentu had the head of a hawk, and therefore must have been a local form of Horus—of that Horus, namely, of whom the Pharaonic Egyptians were the followers. Like Horus, too, he was a fighting god, and was accordingly identified in the texts of the Nineteenth Dynasty with the Canaanitish Baal, “the Lord of hosts.” But he was also incarnated in the sacred bull which was worshipped at Erment, and of which I have spoken in an earlier lecture. He thus differed from Amon, who was identified with the ram, the sacred animal of the aboriginal population, not at Karnak only, but in the whole of the surrounding district.

But Amon was usually of human form, with two lofty feathers rising above his crown. Under the Theban dynasties he became the supreme god, first of Egypt, then of the Egyptian empire. All other gods had to give way before him, and to lose their individuality in his. His supremacy began with the rise of the Eleventh and Twelfth Dynasties; it was checked for a moment by the Hyksos conquest of Egypt, but in the end the check proved only a fresh impulse. It was the princes of Thebes, the servants of Amon, who raised the standard of revolt against the Asiatic intruder, and finally drove him back to Asia. Amon had been their helper in the war of independence, and it was he who afterwards gained their victories for them in Syria and Ethiopia. The glory and wealth of Egypt were all due to him, and upon his temple and city accordingly the spoils of Asia were

1 Professor Wiedemann has suggested that the name of Men-tu or Mon-tu is connected with that of A-mon. It is, however, more reasonable to associate it with that of the Mentiu or Semitic nomads of the Sinaitic Peninsula.

2 Hence the ram-headed sphinxes that lined the roads leading to the temple of Karnak. The flesh of the ram was tabooed at Thebes, an indication that the animal was originally a totem (cf. Herod. ii. 42).
lavished, and trains of captives worked under the lash. The Hyksos invasion, moreover, and the long war of independence which followed, destroyed the power of the old feudal princes, while it strengthened and developed that of the Pharaoh. The influence of the provincial gods passed away with the feudal princes whose patrons they had been; the supremacy of the Pharaoh implied also the supremacy of the Pharaoh's god. There was none left in Egypt to dispute the proud boast of the Theban, that Amon was "the one god."

But he became the one god not by destroying, but by absorbing the other gods of the country. The doctrines of the Ennead and the Trinity had prepared the way. They had taught how easily the gods of the State religion could be merged one into the other; that their attributes were convertible, and yet, at the same time, were all that gave them a distinct personality. The attributes were to the Egyptian little more than the concrete symbols by which they were expressed in the picture writing; the personality was little more than a name. And both symbols and name could be changed or interchanged at will.

The process of fusion was aided by the identification of Amon with Ra. The spread of the solar cult of Heliopolis had introduced the name and worship of Ra into all the temples of Egypt; the local gods had, as it were, been incorporated into him, and even the goddesses forced to become his wives or his daughters. The Pharaoh, even the Theban Pharaoh, was still "the son of the sun-god"; as Amon was also his "father," it was a necessary conclusion that Amon and Ra were one and the same.

In the Theban period, accordingly, Amon is no longer a simple god. He is Amon-Ra, to whom all the attributes of Ra have been transferred. The solar element is
predominant in his character; and, since the other gods of the country are but subordinate forms of Amon, in their characters also. Most of the religious literature of Egypt which we possess belongs to the Theban period or is derived from it; it is not astonishing, therefore, if Egyptologists have been inclined to see the sun-god everywhere in Egyptian theology.

The Theban trinity was modelled on the orthodox lines. Mut, "the mother," a local epithet of the goddess of Southern Egypt, was made the wife of Amon, while Khonsu, a local moon-god, became his son. But in acquiring this relationship Khonsu lost his original nature. Since the divine son was one with his divine father, he too became a sun-god, with the solar disc and the hawk's head. As the designer of architectural plans, however, he still preserved a reminiscence of his primal character. But he was eventually superseded by Mentu, a result of the decadence of Thebes and the rise of Erment to the headship of the nome. It is needless to say that Mentu had long before become Mentu-Ra.

We can trace the evolution of Amon, thanks to the multiplicity of the texts which belong to the period when his city was supreme. We can watch him as he rises slowly from the position of an obscure provincial deity to that of the supreme god of all Egypt, and can follow the causes which brought it about. We can see him uniting himself with the sun-god, and then absorbing the rest of the Egyptian gods into himself. The theological thought, of which he was the subject and centre, gradually but inexorably passes from a narrow form of polytheism into a materialistic pantheism. There, however, it ends. It never advances further into a monotheism in which

1 A stela of Antef IV., found by M. Legrain in 1900, shows that Khonsu was preceded by Ptah as the third member of the trinity. See above, p. 90.
the creator is separate from his creation. With all its spirituality, the Egyptian conception of the divine remained concrete; the theologians of Egypt never escaped the influence of the symbol or recognised the god behind and apart from matter. It was through matter that they came to know God, and to the last it was by matter that their conception of the Godhead was bounded.
LECTURE VII.

OSIRIS AND THE OSIRIAN FAITH.

The legend of Osiris as it existed at the end of the first century is recorded by Plutarch. It has been pieced together from the myths and folk-tales of various ages and various localities that were current about the god. The Egyptian priests had considerable difficulty in fitting them into a consistent story; had they been Greek or Roman historiographers, they would have solved the problem by declaring that there had been more than one Osiris; as it was, they were contented with setting the different accounts of his death and fortunes side by side, and harmonising them afterwards as best they might.

As to the general outlines of the legend, there was no dispute. Osiris had been an Egyptian Pharaoh who had devoted his life to doing good, to introducing the elements of art and culture among his subjects, and transforming them from savages into civilised men. He was the son of the sun-god, born on the first of the intercalary days, the brother and husband of Isis, and the brother also of Set or Sut, whom the Greeks called Typhon. Typhon had as wife his sister Nephthys or Nebhât, but her son Anubis, the jackal, claimed Osiris as his father.

Osiris set forth from his Egyptian kingdom to subdue the world by the arts of peace, leaving Isis to govern in his absence. On his return, Set and his seventy-two fellow conspirators imprisoned him by craft in a chest, which was thrown into the Nile. In the days when Canaan had
become a province of the Egyptian empire, and there were close relations between the Phoenician cities and the Delta, it was said that the chest had floated across the sea to Gebal, where it became embedded in the core of a tree, which was afterwards cut down and shaped into one of the columns of the royal palace. Isis wandered from place to place seeking her lost husband, and mourning for him; at last she arrived at Gebal, and succeeded in extracting the chest from its hiding-place, and in carrying it back to Egypt. But the older version of the legend knew nothing of the voyage to Gebal. The chest was indeed found by Isis, but it was near the mouths of the Nile. Here it was buried for awhile; but Set, while hunting by night, discovered it, and, tearing open its lid, cut the body inside into fourteen pieces, which he scattered to the winds. Then Isis took boat and searched for the pieces, until she had recovered them all save one. Wherever a piece was found, a tomb of Osiris arose in later days. Carefully were the pieces put together by Isis and Nephthys, and Anubis then embalmed the whole body. It was the first mummy that was made in the world.

Meanwhile Horus the younger had been born to Isis, and brought up secretly at Buto, in the marshes of the Delta, out of reach of Set. As soon as he was grown to man's estate he gathered his followers around him, and prepared himself to avenge his father's death. Long and fierce was the struggle. Once Set was taken prisoner, but released by Isis; whereupon Horus, in a fit of anger, struck off his mother's head, which was replaced by Thoth with the head of a cow. According to one account, the contest ended with the victory of Horus. The enemy were driven from one nome to another, and Horus sat on the throne of his father. But there were others who said that the struggle went on with alternating success,
until at last Thoth was appointed arbiter, and divided Egypt between the two foes. Southern Egypt was given to Horus, Northern Egypt to Set.

It is somewhat difficult to disentangle the threads out of which this story has been woven. Elements of various sorts are mixed up in it together. Horus the younger, the posthumous son of Osiris, has been identified with Horus the elder, the ancient sun-god of Upper Egypt, and the legends connected with the latter have been transferred to the son of Isis. The everlasting war between good and evil has been inextricably confounded with the war between the Pharaonic Egyptians and the older population. The solar theology has invaded the myth of Osiris, making him the son of Ra, and investing him with solar attributes. Anubis the jackal, who watched over the cemeteries of Upper Egypt, has been foisted into it, and has become the servant and minister of the god of the dead who superseded him. The doctrine of the Trinity has been applied to it, and Anubis and Nephthys, who originally were the allies of Osiris, have been forced to combine with Set. Here and there old forgotten customs or fragments of folk-lore have been embodied in the legend: the dismemberment of Osiris, for example, points to the time when the neolithic inhabitants of Egypt dismembered their dead; and the preservation of the body of Osiris in the heart of a tree has its echo in the Tale of the Two Brothers, in which the individuality of the hero was similarly preserved. The green face with which Osiris was represented was in the same way a traditional reminiscence of the custom of painting the face of the dead with green paint, which was practised by the neolithic population of Egypt.

There are three main facts in the personality of Osiris which stand out clearly amid the myths and theological inventions which gathered round his name. He was a
human god; he was the first mummy; and he became the god of the dead. And the paradise over which he ruled, and to which the faithful souls who believed in him were admitted, was the field of Alu, a land of light and happiness.

*Sekhet Alu,* "the field of Alu," seems to have been the cemetery of Busiris among the marshes of the Delta. The name meant "the field of marsh-mallows,"—the "asphodel meadows" of the *Odyssey,—and was applied to one of the islands which were so numerous in the north-eastern part of the Delta. Here, then, in the nome of which Osiris was the feudal god, the paradise of his followers originally lay, though a time came when it was translated from the earth to the sky. But when Osiris first became lord of the dead, the land to which they followed him was still within the confines of Egypt.

It would seem, therefore, that Professor Maspero is right in holding that Osiris was primarily the god of Busiris in the Delta. It is the only nome of which he was formally the presiding deity, under the title of *Anz, "the king," and it bordered on Hermopolis, which was dedicated to the ibis-god Thoth, who is so closely connected with the story of Osiris. To the north stood the temple of Isis-Rennet, to the south-west was Pharbaethos (Horbêt), which worshipped Set, while Horus was the god of many of the neighbouring nomes. The whole cycle of Osirian deities is thus to be found within the confines of a small tract of the Delta.

2 The bronze figures of the ibis found at Tel el-Baqliya, on the east bank of the Damietta branch of the Nile, opposite Abusir or Busiris, have shown that it is the site of the capital of the Hermopolite nome.
3 At Beḥbêt near Mansūra.
The name Busiris means simply "the place of Osiris." Primitively it had been called Daddu, "the two colonnades," and Osiris became known as its lord. It was under this title that he was incarnated in the ram of the neighbouring town of Mendes on the eastern boundary of Hermopolis. The ram became his soul; all the more easily since the Egyptian words for "ram" and "soul" had the same or a similar pronunciation. At Dendera it is said that in the ram of Mendes Osiris grew young again; and in the later days of solar syncretism the four souls of Ra and Osiris, of Shu and Khepera, were united in its body. How far back this identification of the god and the sacred animal may reach we do not know. But it is significant that it was not at Daddu itself, but at a neighbouring city, that the animal was worshipped, though a seal-cylinder which belongs to the oldest period of Egyptian history already declares that Daddu was "the city of the ram."  

Nebhât and Anubis had originally nothing to do with the god of Busiris. Nebhât, in fact, is merely a title which has been fossilised into the name of a deity. It is merely the ordinary title of the Egyptian lady as "the mistress of the house," who thus stands on the same footing as "the lord of the house," her husband. The title could have been given to any goddess who was conceived of in human form, and was doubtless applied.

1 This, at least, is how the name is usually written. But on an early seal-cylinder which I have published in the Proc. SBA., Feb. 1898, No. 2, where we read, "The city of the ram, the city which is called Dad," the name is written D-d, and on a libation-table of the Sixth Dynasty from El-Kab we find Dad-á-u (Quibell, El-Kab, pl. iv. 1). The earlier pronunciation of the name as found in the Pyramid texts is Zaddu or Zadu.

2 As early as the age of the Pyramid texts the column Dad had come to be explained as a picture of the spine, or rather spinal column (zad), of Osiris, which was supposed to be preserved at Daddu or Pi-Asar-neb-Daddu or Abusir. See Unas 7.
to Isis the wife of Osiris. He was "the lord" of the city; she, "the lady of the house." It reminds us of the way in which the deities of Babylonia were addressed. There, too, the god was "the lord," the goddess "the lady." The old titles of Osiris and Isis which have thus survived in the Osirian myth are essentially Babylonian.

Nebhât or Nephthys was individualised in order to complete the trinity of Set, of which Set was the central figure. We can tell, accordingly, when she thus developed into a separate goddess. It was when the doctrine of the Trinity first became dominant in the Egyptian schools of theology, and all the chief deities of the country were forced to conform to it. Anubis, the second person in the trinity of Set, must have already been attached to the cult of Osiris. How this came about is not difficult to discover. Anubis the jackal was the god of the underworld. Like his symbol, the jackal, he watched over the tombs, more especially in "the mountain" far away from the cultivated land. His sacred animal already appears mounted on its standard on the early slate plaques of Nekhen and Abydos by the side of the Horus-hawk. He was, in fact, worshipped in many of the nomes, above all at Siût, where he was adored as "the opener of the paths" to the world below. He was the inventor of the art of embalming; he must therefore have been the god of the dead when the Pharaonic Egyptians first settled themselves in Upper Egypt. In one sense, indeed, he was younger than Horus, since "the followers of Horus" had not brought the art with them from their earlier home; but he was already god of the dead, and the discovery of the art was accordingly ascribed to him.

The acceptance of Osiris as the god of the underworld meant the displacement of Anubis. He had to make
way for "the lord of Daddu." The fact is a striking illustration of the influence which the Osirian teaching must have possessed. Osiris was the feudal god only of a nome in the north of the Delta; Anubis had been adored from time immemorial throughout the valley of the Nile. The cities which recognised him as their chief deity were numerous and powerful. Nevertheless he had to yield to the rival god and take a subordinate place beside him. He remained, indeed, in the pantheon, for the Egyptians never broke with their past; but the part he had played in it was taken by another, and he was content to become merely the minister of Osiris and the guardian of the cemeteries of the dead.

Meanwhile Osiris, like the Greek Dionysos, had pursued his victorious march. Wherever his worship extended his temple rose by the side of his tomb like the temples attached to the Pyramids. Like Ptah of Memphis or the mummified Horus of Nekhen, he was a dead god, and it was to a dead god consequently that the offering was made and the priest dedicated. It was at Abydos in Upper Egypt, however, that his fame was greatest. Abydos was the sepulchral temple of Osiris attached to the city of This, and This was not only the seat of a powerful kingdom, which probably succeeded that of Nekhen, but the birthplace of Menes, the founder of the united monarchy. Around the tomb of the Osiris of Abydos, accordingly, the kings and princes of the Thinite dynasties were buried, and where the Pharaoh was buried his subjects wished to be buried too. From all parts of Egypt the bodies of the dead were brought to the sacred ground, that they might be interred as near as possible to the tomb of the god, and so their mummies might repose beside him on earth as they hoped their souls would do in the paradise of the Blest. Even the rise of the Memphite dynasties did not deprive
Abydos of its claim to veneration. Its sanctity was too firmly established; hundreds of Egyptians still continued to be buried there, rather than in the spacious necropolis of the Memphite Pharaohs.\(^1\) Abydos, with its royal memories, threw the older city of Osiris into the shade. He still, it is true, retained his ancient title of "lord of Daddu," but it was an archaism rather than a reality, and it was as "lord of Abydos" that he was now with preference addressed.

But other sanctuaries disputed with Abydos its claim to possess the tomb of the god of the dead. Wherever a temple was erected in his honour, his tomb also was necessarily to be found. An attempt was made to harmonise their conflicting claims by falling back on the old tradition of the custom of dismembering the dead: the head of the god was at Abydos, his heart at Athribis, his neck at Letopolis. But even so the difficulty remained: the separate limbs would not suffice for the number of the tombs, and the same member was sometimes claimed by more than one locality. At Memphis, for example, where Osiris was united with Apis into the compound Serapis, his head was said to have been interred as well as at Abydos.

Abydos, at the outset, was the cemetery, or rather one of the cemeteries, of This. And the god of This was the sun-god Anher, who was depicted in human form. In the age which produced the doctrine of the Ennead, Anher was identified with Shu, the atmosphere, or, more strictly speaking, the god of the space between sky and earth was merged into the god of the sun. But it was

\(^1\) Not unfrequently a rich Egyptian who was buried at Saqqâra had a cenotaph at Abydos. I believe that the fashion had been set by the founder of the united monarchy himself, and that besides the tomb of Aha at Negada there was also a cenotaph of the king at Abydos. At all events clay impressions of the Ka-name Aha have been found there in the Omm el-Ga'ab.
not only at This that Anher was worshipped. He was also the god of Sebennytos, which adjoined the Busirite nome, and where, therefore, the human sun-god was in immediate contact with the human god of the dead. What the mummy was to the living man, that Osiris was to Anher.¹

The double relation between Osiris and Anher in both Lower and Upper Egypt cannot be an accident. Osiris became the god of Abydos, because Abydos was the cemetery of This, whose feudal god was Anher. The relation that existed in the Delta, between Anher the sun-god of Sebennytos, and Osiris the god of the dead at Busiris, was transferred also to Southern Egypt.

Whom or what did Osiris originally represent? To this many answers have been given. Of late Egyptologists have seen in him sometimes a personification of mankind, sometimes the river Nile, sometimes the cultivated ground. After the rise of the solar school of theology the Egyptians themselves identified him with the sun when it sinks below the horizon to traverse the dark regions of the underworld. Horus the sun-god of morning thus became his son, born as it were of the sun-god of night, and differing from his father only in his form of manifestation.²

¹ The title borne by Osiris at Abydos was Khent-amentit, “the ruler of the west.” There is no need of turning the title into a separate god who was afterwards identified with Osiris: he was as much Osiris as was Neb-Daddu, “the lord of Daddu.” Professor Maspero says with truth that “Khent-amentit was the dead Anher, a sun which had set in the west” (Études de Mythologie et d’Archéologie égyptiennes, ii. p. 24)—or rather, perhaps, a sun that was setting in the west, as his domain was the necropolis of Omm el-Ga‘ab, immediately eastward of the western boundary of hills. When “Osiris of Daddu” is distinguished from “Khent-Amentit of Abydos,” as on a stela of the Eleventh Dynasty (Daressy in the Recueil de Travaux, xiv. p. 23), this is only in accordance with the Egyptian habit of transforming a divine epithet into a separate deity.

² Already in the Pyramid texts Horus is said to have assisted in the
We have, however, one or two facts to guide us in determining the primitive character of the god. He was a mummified man like Ptah of Memphis, and he was the brother and enemy of Set. Set or Sut became for the later Egyptians the impersonation of evil. He was identified with Apophis, the serpent of wickedness, against whom the sun-god wages perpetual war; and his name was erased from the monuments on which it was engraved. But all this was because Set was the god and the representative of the Asiatic invaders who had conquered Egypt, and aroused in the Egyptian mind a feeling of bitter animosity towards themselves. As late as the time of the Nineteenth Dynasty, the Pharaohs who restored Tanis, the Hyksos capital, to something of its former glory, called themselves after the name of the Hyksos deity. Thothmes III. of the Eighteenth Dynasty built a temple in honour of Set of Ombos, who was worshipped near Dendera; and if we go back to the oldest records of the united monarchy, we find Set symbolising the north while Horus symbolises the south. Before the days of Menes, Set was the god of Northern Egypt, Horus of Southern Egypt. In the prehistoric burial of Osiris, who goes to the plains of Alu with “the great gods that proceed from On” (Pepi II. 864–872); and we have perhaps a reminiscence of the spread of the Osirian cult to the south and the identification of Osiris with Akhem, the mummified Horus of Nekhen, in Pepi II. 849, where we read: “Seb installs by his rites Osiris as god, to whom the watchers in Pe make offering, and the watchers in Nekhen venerate him” (Maspero in the Recueil de Travaux, xii. p. 168). Pe and Nekhen were the capitals of the two pre-Menie kingdoms of Northern and Southern Egypt, and on a stela from Nekhen (Kom el-Ahmar) in the Cairo Museum, “Horus of Nekhen” is identified with Osiris (Recueil de Travaux, xiv. p. 22, No. xx.). In the inscriptions of the Pyramid of Pepi II., lines 864–5, it is said that Isis and Nebhât wept for Osiris at Pe along with “the souls of Pe.” Pe with its temple of the younger Horus, and Dep with its temple of Uazit the goddess of the north, together formed the city called Buto by the Greeks.
wars of the two kingdoms the two gods would be hostile to one another, and yet brethren.

It was the armies of Set that were driven by Horus and his metal-bearing followers from one end of Egypt to the other, and finally overcome.\(^1\) Set therefore represents in the legend the older population of the valley of the Nile. The reason of this is not far to seek. Set or Sut, like Sati, denotes the Semitic or African nomad of the desert, the Babylonian Sutu. He is the equivalent of the Bedâwi of to-day, who still hovers on the Egyptian borders, and between whom and the fellah there is perpetual feud. The same cause which made Horus the brother and yet the enemy of Set must have been at work to place Osiris in the same relation to him. Osiris too must have typified the Pharaonic Egyptian, and like Horus have been the first of the Pharaohs. Hence his human body, and hence also the confusion between himself and Horus, which ended in making Horus his son and in generating a new Horus—Horus the younger —by the side of the older Horus of the Egyptian faith.\(^2\)

The position of Osiris in respect to Anher is now clear. He is the sun-god after his setting in the west, when he has passed to the region of the dead in the underworld. He stands, therefore, in exactly the same relation to Anher that the mumified hawk stands to the Horus-hawk. The one belongs to the city of the living, the other to the city of the dead. But they are both the same deity under different forms, one of which presides over the city, the other over its burying-ground. Like Horus, Osiris must have been a sun-god of the

\(^1\) So in the Pyramid texts (e.g. Teta 171, 172).

\(^2\) The origin of the name of Set had already been forgotten in the age of the Pyramid texts, where it is explained by the determinative set, "a stone."
Pharaonic Egyptians, but a sun-god who was connected for some special reason with the dead.¹

Now Mr. Ball has drawn attention to the fact that there was a Sumerian god who had precisely the same name as Osiris, and that this name is expressed in both cases by precisely the same ideographs.² The etymology of the name has been sought in vain in Egyptian. But the cuneiform texts make it clear. Osiris (As-ar) is the Asari of ancient Babylonia, who was called Merodach by the Semites, and whose ordinary title is "the god who does good to man." The name of Asari is written with two ideographs, one of which denotes "a place" and the other "an eye," and the forms of the two ideographs, as well as their meanings, are identical with those of the hieroglyphic characters which represent Osiris. Such a threefold agreement cannot be accidental: both the name and the mode of writing it must have come from Babylonia. And what makes the agreement the stronger is the fact that the ideographs have nothing to do with the signification of the name itself; they express simply its pronunciation. In the Sumerian of early Babylonia the name signified "the mighty one."³

Asari was the sun-god of Eridu, the ancient seaport of Babylonia on the Persian Gulf. He was the son of Ea, the chief god of the city, of whose will and wisdom he was the interpreter. It was he who communicated to men the lessons in culture and the art of healing, which

¹ When the hieroglyphic name of the Busirite nome was first invented, Osiris was still the living "lord of Daddu" rather than the mummified patron of its necropolis, since it represents him as a living Pharaoh with the title of ēnzi or "chieftain."

³ The origin of the name of Osiris had been forgotten by the Egyptians long before the age of the Pyramid texts, where we find (Unas 229) the grammatical goddess User-t invented to explain Osiris, as if the latter were the adjective user, "strong"! M. Grébaut long ago expressed his belief that Osiris was of foreign origin (Recueil de Travaux, i. p. 120).
Ea was willing they should learn. Just as Osiris spent his life in doing good, according to the Egyptian legend, so Asari was he “who does good to man.” He was ever on the watch to help his worshippers, to convey to them the magic formulae which could ward off sickness or evil, and, as it is often expressed, to “raise the dead to life.”

In this last expression we have the key to the part played by Osiris. Osiris died, and was buried, like Asari or Merodach, whose temple at Babylon was also his tomb; but it was that he might rise again in the morning with renewed strength and brilliancy. And through the spells he had received from his father all those who trusted in him, and shared in his death and entombment, were also “raised to life.” Both in Egypt and in Babylonia he was the god of the resurrection, whether that took place in this visible world or in the heavenly paradise, which was a purified reflection of the earth.

In Babylonia, Asari or Merodach was the champion of light and order, who conquered the dragon of chaos and her anarchic forces, and put the demons of darkness to flight. In Egypt that part was taken by Horus. But both Anher and Osiris were merely local forms—local names, if the phrase should be preferred—of Horus and the mummified hawk. Anher is sometimes represented, like Horus, with the spear in his hand, overthrowing the wicked; but his figure was eclipsed by that of Osiris, who had come to be regarded as the benefactor of mankind, and to whom men prayed in sickness and death. A god of the dead, however, could not be a conqueror; it was he, and not his foe, who had died, and consequently the victories gained by Horus could not be ascribed to him. But the difficulty was not insoluble; Horus became his son, who was at the same time his father,
and the old struggle between Horus and Set was transferred to the Osirian cult.

It is significant, however, that in the recently-recovered monuments of the Thinite dynasties Set is still the twin-brother of Horus. He still represents the north, until lately the antagonist of the south; and a king whose remains have been found at Nekhen and Abydos, and who calls himself "the uniter of the two sceptres" of Egypt, still sets the Horus-hawk and the animal of Set above his name.

Set, as I have already said, is the Sutu or Bedâwi. He was adored elsewhere than in Egypt; the Moabites called themselves his children (Num. xxiv. 17), and in the cuneiform texts Sutu-sar ("Sutu the king") and Nabu-rabê ("Nebo the great") are described as twins. But in Egypt he represented the population which had been conquered by the Pharaonic Egyptians or continued to live on the desert frontiers of the country, and which was stronger in the Delta than in the south. The old struggle, therefore, between light and darkness, order and confusion, which formed the background of Babylonian mythology, became the struggle which was waged for such long centuries, first between the Pharaonic Egyptians and the neolithic races, then between the kingdoms of the south and north, and finally between the united monarchy and the Bedâwin of the desert or assailants from Asia. Where the foreign element prevailed, Set was an honoured god; where the ruling Egyptian was dominant, his place was taken by his brother and his antagonist.

It has been thought that the struggle between Horus and Set typified the struggle that is ever going on

1 Nebo or Nabium (Nabu), "the prophet," was the interpreter of the will of Merodach, just as Merodach was the interpreter of the will of Ea.
between the desert and the cultivated land. But such an idea is far too abstract to have formed the basis of an Egyptian religious myth. It might have been elaborated subsequently by some theological school out of the contrast between the Sutu of the desert and the god of the agriculturists; but it could never have been there originally. The interpretation is as little justifiable as that which sees in Osiris the seed that is buried in the ground.

It is indeed true that the Egyptians of a later period, when the Osirian doctrine of the Resurrection was fully developed, found an analogy to it in the seed that is sown in order to grow again. The tomb of Ma-her-pa-Ra, the fan-bearer of Amon-hotep II. of the Eighteenth Dynasty, discovered by M. Loret in the valley of the Tombs of the Kings at Thebes, contains a proof of this. In it was a rudely-constructed bed with a mattress, on which the figure of Osiris had been drawn. On this earth was placed, and in the earth grains of corn had been sown. The corn had sprouted and grown to the height of a few inches before it had withered away. But such symbolism is, like the similar symbolism of Christianity, the result of the doctrine of the resurrection and not the origin of it. It is not till men believe that the human body can rise again from the sleep of corruption, that the growth of the seed which has been buried in the ground is invoked to explain and confirm their creed.

How came this doctrine of the resurrection to be attached to the cult of Osiris and to become an integral part of Egyptian belief? There is only one answer that can be given to this: the doctrine of the resurrection was a necessary accompaniment of the practice of mummification, and Osiris was a mummified god.

We have already seen that old Babylonian hymns
describe Asari or Merodach as the god "who raises the dead to life." We have also seen that Osiris was not the only mummified god known in Egypt. Ptah of Memphis was also a mummy; so too was the mummi-
ified Horus of Nekhen, who was worshipped even in the Delta in the "Arabian" nome of Goshen on the borders of Asia. Whether or not the practice of embalming first originated at Nekhen, where it was discovered that bodies buried in the nitrogenous soil of El-Kab were preserved undecayed, it is certain that, like the art of writing, it characterised the Pharaonic Egyptians from the earliest times. In no other way can we explain the existence among them of their mummi-
ified gods. But its adoption by the older races who still formed the bulk of the people was but gradual. It did not become universal before the age of the Eighteenth Dynasty.

It was not, however, the bulk of the people, but the ruling classes, who worshipped Osiris, and among whom his cult spread and grew. He became for them Un-
nefer, "the good being," ready to heal for them even the pains of death, and to receive them in his realm beyond the grave, where life and action would be re-
stored to them. The sun shone there as it did here, for was not Osiris himself a sun-god? the fields of the blessed were like those of Egypt, except that no sickness or death came near them, that no blight ever fell on fruit or corn, that the Nile never failed, and that the heat was always tempered by the northern breeze.

The "field of Alu," the Elysion of the Greeks, was at first in the marshes of the Delta near the mouths of the Nile, like the paradise of early Babylonia, which too was "at the mouth of the rivers." But it soon migrated to the north-eastern portion of the sky, and the Milky Way became the heavenly Nile. Here the dead lived
in perpetual happiness under the rule of Osiris, working, feasting, reading, even fighting, as they would below, only without pain and eternally.¹

But, in order to share in this state of bliss, it was necessary for the believer in Osiris to become like the god himself. He must himself be an Osiris, according to the Egyptian expression. His individuality remained intact; as he had been on earth, so would he be in heaven. The Osiris, in fact, was a spiritualised body in which the immortal parts of man were all united together. Soul and spirit, heart and double, all met together in it as they had done when the individual was on earth.

It is clear that the doctrine of the Osiris in its developed form is inconsistent with the idea of the ka. But it is also clear that without the idea of the ka it would never have been formed. Both presuppose an individuality separate from the person to which it belongs, and yet at the same time material, an individuality which continues after death and manifests itself under the same shape as that which characterised the person in life. The popular conception of the ghost, which reproduces not only the features but even the dress of the dead, is analogous. Fundamentally the Osiris is a ka, but it is a ka which represents not only the outward shape, but the inner essence as well. The whole man is there, spiritually, morally, intellectually, as well as corporeally. The doctrine of the Osiris thus absorbs, as it were, the old idea of the ka, and spiritualises it, at the same time confining it to the life after death.

¹The constellation of Osiris was called "the soul of Osiris," and Professor Maspero notes that the Pyramid texts place his kingdom near the Great Bear (Études de Mythologie et d'Archéologie, ii. p. 20). Isis became Sirius, and Horus the morning star.
But if the conception of a double, unsubstantial and yet materialised, underlay the belief in the Osiris, the practice of embalming was equally responsible for it. The continued existence of the double was dependent on the continued existence of the body, for the one presupposed the other, and it was only the mummified body which could continue to exist. As long as the double was believed to haunt the tomb, and there receive the food and other offerings which were provided for it, the connection between it and the mummy presented no difficulties. But when the Egyptian came to look forward to the heaven of Osiris, first on this nether earth and then in the skies, the case was wholly altered. The mummy lay in the tomb, the immortal counterpart of the man himself was in another and a spiritual world. The result was inevitable: the follower of Osiris soon assured himself that one day the mummified body also would have life and action again breathed into it and rejoin its Osiris in the fields of paradise. Had not the god carried thither his divine body as well as its counterpart? and what the god had done those who had become even as he was could also do.

In this way the doctrine of the resurrection of the body became an integral part of the Osirian faith. The future happiness to which its disciples looked forward was not in absorption into the divinity, or contemplation of the divine attributes, or a monotonous existence of passive idleness. They were to live as they had done in this life, only without sorrow and suffering, without sin, and eternally. But all their bodily powers and interests were to remain and be gratified as they could not be in this lower world. The realm over which Osiris ruled was the idealised reproduction of that Egypt which the Egyptian loved so well, with its sunshine and light, its broad and life-bearing river, its fertile fields,
and its busy towns. Those who dwelt in it could indeed feast and play, could lounge in canoes and fish or hunt, could read tales and poems or write treatises on morality, could transform themselves into birds that alighted among the thick foliage of the trees; but they must also work as they had done here, must cultivate the soil before it would produce its ears of wheat two cubits high, must submit to the corvée and embank the canals. The Osirian heaven had no place for the idle and inactive.

No sooner, indeed, had the dead man been pronounced worthy of admittance to it, than he was called upon to work. At the very outset of his new existence, before any of its pleasures might be tasted, he was required to till the ground and guide the plough. This was no hardship to the poor fellah who had spent his life in agricultural labour. But it was otherwise with the rich man whose lands had been cultivated by others, while he himself had merely enjoyed their produce. In the early days of Egyptian history, accordingly, it was the fashion for the feudal landowner to surround his tomb with the graves of his servants and retainers, whose bodies were mummmified and buried at his expense. What they had performed for him in this world, it was believed they would perform for him in the world to come. There, too, the Osiris of the fellah would work for the Osiris of the wealthy, whose necessary task would thus be performed vicariously.

But as time went on a feeling grew up that in the sight of Osiris all those who were assimilated to him were equal one to the other. Between one Osiris and another the distinctions of rank and station which prevail here were no longer possible. The old conception of the ka came to the help of the believer. The place of the human servant was taken by the ushebti, that little
figure of clay or wood which represented a peasant, and whose double, accordingly, was sent to assist the dead in his tasks above. The human Osiris, whatever his lot in this life had been, was henceforth free from the toils which had once awaited him in the fields of Alu; he could look on while the *ka* of the *ushebti* performed his work. The *ushebti*-figures became especially numerous after the expulsion of the Hyksos. The domination of the foreigner and the long war of independence which put an end to it, had destroyed the feudal nobility, and therewith the feudal ideas which regarded mankind as divided, now and hereafter, into two classes. From thenceforth the Egyptians became the democratic people that they still are. As the Pharaoh on earth ruled a people who before him were all equal, so between the subjects of Osiris, the Pharaoh in heaven, no distinctions of rank were known except such as were conferred by himself.

The same belief which had substituted the *ushebti* for the human peasant had filled the tombs with the objects which, it was thought, would best please the dead man. Besides the meat and drink which had been provided for the *ka* from time immemorial, there was now placed beside the mummy everything which it was imagined he would need or desire in the other world. Even the books which the dead man had delighted in during his earthly existence were not forgotten. It was not necessary, however, that the actual objects should be there. It was the *ka* only of the object that was wanted, and that could be furnished by a representation of the object as well as by the object itself. And so, besides the actual clothes or tools or weapons that are buried in the tombs, we find imitation clothes and tools, like the "ghost-money" of the Greeks, or even paintings on the wall, which, so long as the object was correctly depicted
in them, were considered quite sufficient. One of the most touching results of this thorough-going realism has been noticed by Professor Wiedemann.¹ "The soles of the feet (of the mummy) which had trodden the mire of earth were removed, in order that the Osiris might tread the Hall of Judgment with pure feet; and the gods were prayed to grant milk to the Osiris that he might bathe his feet in it and so assuage the pain which the removal of the soles must needs have caused him. And, finally, the soles" were then placed within the mummy, that he might find them at hand on the day of resurrection, and meantime make use of their ka.

The doctrine of the resurrection of the body involved also a doctrine of a judgment of the deeds committed by the body. Those only were admitted into the kingdom of Osiris who, like their leader, had done good to men. A knowledge of the Ritual with its divine lore and incantations was not sufficient to unlock its gates. The Osiris who entered it had to be morally as well as ceremonially pure. Osiris was not only a king; he was a judge also, and those who appeared before him had to prove that their conduct in this life had been in conformity with one of the highest of the moral codes of antiquity.

This moral test of righteousness is the most remarkable fact connected with the Osirian system of doctrine. The Egyptian who accepted it was called on to acknowledge that orthodoxy in belief and practice was not sufficient to ensure his future salvation; it was needful that he should have avoided sin and been actively benevolent as well. Unlike most ancient forms of faith, morality—and that too of a high order—was made an integral part of religion, and even set above it. It was not so much what a man believed as what he had done

¹ The Ancient Egyptian Doctrine of Immortality, p. 48.
that enabled him to pass the awful tribunal of heaven
and be admitted to everlasting bliss.

The Book of the Dead was the guide of the dead man
on his journey to the other world. Its chapters were
inscribed on the rolls buried with the mummy, or were
painted on the coffin and the walls of the tomb. It
was the Ritual which prescribed the prayers and incanta-
tions to be repeated in the course of the journey,
and described the enemies to be met with on the other
side of the grave. Thanks to its instructions, the dead
passed safely through the limbo which divides this earth
from the kingdom of Osiris, and arrived at last at the
Judgment Hall, the hall of the Twofold Truth, where
Mât, the goddess of truth and law, received him. Here
on his judgment throne sat Osiris, surrounded by the
forty-two assessors of divine justice from the forty-two
nomes of Egypt, while Thoth and the other deities of
the Osirian cycle stood near at hand. Then the dead
man was called upon to show reason why he should be
admitted to the fields of Alu, and to prove that during
his lifetime he had practised mercy and justice and had
abstained from evil-doing. The negative confession put
into his mouth is one of the most noteworthy relics of
ancient literature. "Praise be to thee (O Osiris)," he was
made to say, "lord of the Twofold Truth! Praise to thee,
great god, lord of the Twofold Truth! I come to thee,
my lord, I draw near to see thine excellencies."

1 Renouf’s translation of the 125th chapter of the Book of the Dead
(Papyrus of Ani) is as follows:—"I am not a doer of what is wrong.
I am not a plunderer. I am not a robber. I am not a slayer of men.
I do not stint the measure of corn. I am not a niggard. I do not desire
the property of the gods. I am not a teller of lies. I am not a monopo-
lisier of food. I am no extortioner. I am not unchaste. I am not
the cause of others’ tears. I am not a dissembler. I am not a doer of
violence. I am not a domineering character. I do not pillage cultivated
land. I am not an eavesdropper. I am not a chatterer. I do not
I have not acted with deceit or done evil to men.
I have not oppressed the poor
I have not judged unjustly.
I have not known ought of wicked things.
I have not committed sin.
I have not exacted more work from the labourer than was just.
I have not been anxious. I have not been feeble of purpose.
I have not defaulted. I have not been niggardly.
I have not done what the gods abhor.
I have not caused the slave to be ill-treated by his master.
I have made none to hunger.
I have made none to weep.
I have not committed murder
I have not caused any man to be treacherously murdered.
I have not dealt treacherously with any one.
I have not diminished the offerings of bread in the temples.
I have not spoiled the shewbread of the gods.
I have not robbed the dead of their loaves and cerecloths.
I have not been unchaste.

dismiss a case through self-interest. I am not unchaste with women or men. I am not obscene. I am not an exciter of alarms. I am not hot in speech. I do not turn a deaf ear to the words of righteousness. I am not foul-mouthed. I am not a striker. I am not a quarreller. I do not revoke my words. I do not multiply clamour in reply to words. I am not evil-minded or a doer of evil. I am not a reviler of the king. I put no obstruction on (the use of the Nile) water. I am not a bawler. I am not a reviler of the god. I am not fraudulent. I am not sparing in offerings to the gods. I do not deprive the dead of the funeral cakes. I take not away the cakes of the child, or profane the god of my locality. I do not kill sacred animals."
I have not defiled myself in the sanctuary of the god of my city.
I have not stinted and been niggardly of offerings.
I have not defrauded in weighing the scales.
I have not given false weight.
I have not taken the milk from the mouth of the child.
I have not hunted the cattle in their meadows.
I have not netted the birds of the gods.
I have not fished in their preserves.
I have not kept the water (from my neighbour) in the time of inundation.
I have not cut off a water channel.
I have not extinguished the flame at a wrong time.
I have not defrauded the Ennead of the gods of the choice parts of the victims.
I have not driven away the oxen of the temple.
I have not driven back a god when he has left the temple.
I am pure! I am pure! I am pure!" ¹

The negative confession ended, the dead man turned to the forty-two assessors and pleaded that he was innocent of the particular sin which they had been severally appointed to judge. Then he once more addressed Osiris with a final plea for justification: "Hail to you, ye gods who are in the great hall of the Twofold Truth, who have no falseshood in your bosoms, but who live on truth in On, and feed your hearts upon it before the lord god who dwelleth in his solar disc. Deliver me from the Typhon who feedeth on entrails, O chiefs! in this hour of supreme judgment; grant that the deceased may come unto you, he who hath not sinned, who hath

¹ Wiedemann, *Die Religion der alten Aegypter*, pp. 132, 133; and Maspero, *Dawn of Civilisation*, pp. 188–190.
neither lied, nor done evil, nor committed any crime, who hath not borne false witness, who hath done nought against himself, but who liveth on truth, who feedeth on truth. He hath spread joy on all sides; men speak of that which he hath done, and the gods rejoice in it. He hath reconciled the god to him by his love; he hath given bread to the hungry, water to the thirsty, clothing to the naked; he hath given a boat to the shipwrecked; he hath offered sacrifices to the gods, sepulchral meals to the dead. Deliver him from himself, speak not against him before the lord of the dead, for his mouth is pure and his hands are pure!”

Meanwhile the heart of the dead man—his conscience, as we should call it in our modern phraseology—was being weighed in the balance against the image of truth. Something more convincing was needed than his own protestation that he had acted uprightly and done no wrong. The heart was placed in the scale by Thoth, who, knowing the weakness of human nature, inclined the balance a little in its favour. Anubis superintended the weighing, while Thoth recorded the result. If the verdict were favourable, he addressed Osiris in the following words: “Behold the deceased in this Hall of the Twofold Truth, his heart hath been weighed in the balance, in the presence of the great genii, the lords of Hades, and been found true. No trace of earthly impurity hath been found in his heart. Now that he leaveth the tribunal true of voice (justified), his heart is restored to him, as well as his eyes and the material cover of his heart, to be put back in their places, each in its own time, his soul in heaven, his heart in the other world, as is the custom of the followers of Horus. Henceforth let his body lie in the hands of Anubis, who presideth over the tombs; let him receive offerings at

the cemetery in the presence of (Osiris) Un-nefer (the Good Being); let him be as one of those favourites who follow thee; let his soul abide where it will in the necropolis of his city, he whose voice is true before the great Ennead.”

In the judgment-hall of Osiris we find the first expression of the doctrine which was echoed so many ages later by the Hebrew prophets, that what the gods require is mercy and righteousness rather than orthodoxy of belief. And the righteousness and mercy are far-reaching. The faith that is to save the follower of Osiris is a faith that has led him to feed the hungry, to give drink to the thirsty, to clothe the naked, to abstain from injuring his neighbour in word or thought, much less in deed, and to be truthful in both act and speech. Even the slave is not forgotten; to have done anything which has caused him to be ill-treated by his master, is sufficient to exclude the offender from the delights of paradise. Man’s duty towards his fellow-man is put on a higher footing even than his duty towards the gods, for it comes first in the list of righteous actions required from him. It is not until the dead man has proved that he has acted with justice and mercy towards his fellows, that he is allowed to pass on to prove that he has performed his duty towards the gods.

And the Osirian confession of faith was not a mere conventional formulary, without influence on the life and conduct of those who professed it. There are already allusions to it in the Pyramid texts, and in the tombs of a later period the deceased rests his claim to be remembered upon the good deeds he had done while on earth. To feed the hungry, to clothe the naked, and to deal justly, are duties which are constantly recognised in them. “I loved my father,” says Baba at El-Kab, “I

honoured my mother. . . . When a famine arose, lasting many years, I distributed corn to the needy.” The Egyptian sepulchres contain few records of war and battles; of deeds of kindness and righteous dealing there is frequent mention.¹

Of the fate of the wicked, of those whose hearts were overweighed in the balance and who failed to pass the tribunal of Osiris, we know but little. Typhon, in the form of a hideous hippopotamus, stood behind Thoth in a corner of the hall, ready to devour their entrails. In the Book of the Other World, of which I shall have to speak in another lecture, the tortures of the lost are depicted quite in medieval style. We see them plunged in water or burned in the fire, enclosed in vaulted chambers filled with burning charcoal, with their heads struck from their necks or their bodies devoured by serpents. But the Book of the Other World is the ritual of a religious system which was originally distinct from the Osirian, and it is probable that most Egyptians expected the final annihilation of the wicked rather than their continued existence in an eternal hell. The divine elements in man, which could not die, were equally incapable of committing sin, and consequently would return to the God who gave them, when the human individuality to which they had been joined was punished for its offences in the flesh. The soul could remain united only to that individuality which had been

¹ So on a stela translated by Professor Maspero (Recueil de Travaux, iv. p. 128) the deceased says: “Never has one said of me, What is that he hath done? I have not injured, I have not committed evil; none has suffered through my fault, the lie has never entered into me since I was born, but I have always done that which was true in the sight of the lord of the two worlds. I have been united in heart to the god; I have walked in the good paths of justice, love, and all the virtues. Ah, let my soul live . . . for behold I am come to this land, O souls, to be with you in the tomb, I am become one of you who detest sin.”
purified from all its earthly stains, and had become as the god Osiris himself. The individuality which was condemned in the judgment of Osiris perished eternally, and in the mind of the Egyptian the individuality and the individual were one and the same.
LIKE all other organised religions, that of ancient Egypt had its sacred books. According to St. Clement of Alexandria, the whole body of sacred literature was contained in a collection of forty-two books, the origin of which was ascribed to the god Thoth. The first ten of these "Hermetic" volumes were entitled "the Prophet," and dealt with theology in the strictest sense of the term. Then followed the ten books of "the Stolist," in which were to be found all directions as to the festivals and processions, as well as hymns and prayers. Next came the fourteen books of "the Sacred Scribe," containing all that was known about the hieroglyphic system of writing, and the sciences of geometry and geography, astronomy, astrology, and the like. These were followed by two books on music and hymnology; and, finally, six books on the science and practice of medicine.1

The Hermetic books were written in Greek, and were a compilation of the Greek age. Such a systematic epitome of the learning of ancient Egypt belonged to the period when Egyptian religion had ceased to be creative,

1 Clem. Alex. Strom. vi. p. 260, ed. Sylb. See Lepsius, Einleitung zur Chronologie der Aegypter, pp. 45, 46. The remains ascribed to Hermes Trismegistos, including the Dialogue called Poemandres, have been translated into English by J. D. Chambers (1882). The Dialogue is already quoted by Justin Martyr (Exhort. ad Græcos, xxxviii.).
or even progressive, and the antiquarian spirit of Greek Alexandria had laid hold of the traditions and institutions of the past. But they were derived from genuine sources, and represented with more or less exactitude the beliefs and practices of earlier generations. They were, it is true, a compilation adapted to Greek ideas and intended to satisfy the demands of Greek curiosity, but it is no less true that the materials out of which they were compiled went back to the remotest antiquity. The temple libraries were filled with rolls of papyri relating not only to the minutest details of the temple service, but also to all the various branches of sacred lore. Among these were the books which have been called the Bibles of the ancient Egyptians.

Foremost amongst the latter is the Ritual to which Lepsius gave the name of the Book of the Dead. It was first discovered by Champollion in the early days of Egyptian decipherment, and a comparative edition of the text current during the Theban period has been made by Dr. Naville. Papyri containing the whole or portions of it are numberless; the chapters into which it is divided are inscribed on the coffins, and even on the wrappings of the dead, as well as on the scarabs and the ushebtis that were buried with the mummy. It was, in fact, a sort of passport and guide-book combined in one, which would carry the dead man in safety through the dangers that confronted him in the other world, and bring him at last to the judgment-hall of Osiris and the paradise of Alu. It described minutely all that awaited him after death; it detailed the words and prayers that would deliver him from his spiritual enemies; and it put into his mouth the confession he would have to make before the tribunal of the dead. Without it he would have been lost in the strange world to which he journeyed, and hence the need of inscribing at least some portions of it on his tomb or
sepulchral furniture, where their ghostly doubles could be read by his ka and soul.

The Book of the Dead was the Bible or Prayer-book of the Osirian creed. Its universal use marks the triumph of the worship of Osiris and of the beliefs that accompanied it. It was for the follower of Osiris that it was originally compiled; the judgment with which it threatened him was that of Osiris, the heaven to which it led him was the field of Alu. The Pyramid texts of the Fifth and Sixth Dynasties imply that it already existed in some shape or other; the Osirian creed is known to them in all its details, and the "other world" depicted in them is that of the Book of the Dead.¹

But the Book of the Dead is a composite work. Not only are the religious conceptions embodied in it composite and sometimes self-contradictory, on the literary side it is composite also. It was, moreover, a work of slow growth; glosses have been added to it to explain passages which had become obscure through the lapse of time; the glosses have then made their way into the text, and themselves become the subject of fresh commentary and explanation. Chapters have been inserted, paragraphs interpolated, and the later commentary com-

¹ The extraordinary care with which the sacred texts were handed down through long periods of time is illustrated by certain of the Pyramid texts, which are reproduced word for word down to the close of the Egyptian monarchy. Thus passages at the beginning of the inscriptions in the Pyramid of Unas are repeated in the Ritual of Abydos, and another portion of the same text is found on a stela of the Thirteenth Dynasty, as well as in one of the courts of the temple of queen Hatshepsu at Dér el-Bâhari, where, as Professor Maspero remarks, "we have three identical versions of different epochs and localities." The invocations against serpents (Unas 300–339) recur in the tomb of Bak-n-ren-ef of the Twenty-sixth Dynasty. See Maspero, Recueil de Travaux, iii. pp. 182, 195, 220. The fact gives us confidence in the statements of the Egyptian scribes, that such and such chapters of the Book of the Dead had been "found" or written in the reigns of certain early kings.
bined with the original text. The Book of the Dead as it appears in the age of the Theban dynasties had already passed through long centuries of growth and modification.¹

The Pyramid texts show the same combination of the doctrines of the Osirian creed with those of the solar cult as the Book of the Dead.² But the combination is that of two mutually exclusive systems of theology which have been brought forcibly side by side without any attempt being made to fuse them into a harmonious whole. They display the usual tendency of the Egyptian mind to accept the new without discarding the old, and without troubling to consider how the new and old can be fitted together. It was enough to place them side by side; those who did not think the Osirian creed sufficient to ensure salvation, had the choice of the solar creed offered them with its prayers and incantations to the sun-god. But it was not an alternative choice; the heaven of the solar bark in its passage through the world of the night was attached to the heaven of Alu with its fields lighted by the sun of day.

It is evident that the chapters which introduce the doctrines of the solar cult are a later addition to the original Book of the Dead. That was the text-book of

¹ There is much to be said for the view of Professor Piehl, that we have in it an amalgamation of the rituals and formulæ of the various chief sanctuaries of Egypt, which have been thrown side by side without any attempt at arrangement or harmony. One of such rituals would be that mentioned on the sarcophagus of Nes-Shu-Tefnut, where we read of "the sacred writings of Horus in the city of Huren" in the Busirite nome (Recueil de Travaux, vi. p. 134). On the sarcophagus of Beb, discovered by Professor Petrie at Dendera, and belonging to the period between the Sixth and the Eleventh Dynasties, we have not only "early versions" of parts of the Book of the Dead, but also chapters which do not occur in the standard text (Petrie, Dendereh, 1898, pp. 56-58).

² We even read in them of Ra being "purified in the fields of Alu" (Unas 411).
the Osirian soul, with whose beliefs the doctrines of the solar cult were absolutely incompatible. While the one taught that the dead, without distinction, passed to the judgment-hall of Osiris, where, after being acquitted, as much on moral as on religious grounds, they were admitted to a paradise of light and happiness, the other maintained that only a chosen few, who were rich and learned enough to be provided with the necessary theological formulæ, were received in the solar bark as it glided along the twelve hours of the night, thus becoming companions of the sun-god in his passage through a realm of darkness that was peopled by demoniac forms. The Osirian and solar creeds issued from two wholly different religious systems, and the introduction of conceptions derived from the latter into the Book of the Dead, however subordinate may be the place which they occupy, indicates a revision of the original work. It was not until the book had gained a predominant position in Egyptian religious thought that it would have been needful to incorporate into it the ideas of a rival theology. But the incorporation had taken place long before the Pyramid texts were compiled, perhaps before the day when Menes united the two kingdoms of Egypt into one.

There are yet other evidences of a composite theology in the Book of the Dead. In one chapter we have the old doctrine of the Ka confined to the dark and dismal tomb in which its body lies; in another we see the soul flying whithersoever it will on the wings of a bird, sitting on the branches of a tree under the shade of the foliage, or perched on the margin of flowing water. But such theological inconsistencies probably go back to the age when the book was first composed. The conceptions of the Ka and of the soul, however inconsistent they may be, belong to so early a period, that they lay together
at the foundation of Egyptian religious thought long before the days when an official form of religion had come into existence, or the Book of the Dead had been compiled.

In some instances it is possible to fix approximately the period to which particular portions of the book belong. Professor Maspero has shown that the 64th chapter, once considered one of the oldest, is in reality one of the latest in date. It sums up the different formulæ which enabled the soul of the dead man to quit his body in safety; and accordingly its title, which, however, varies in different recensions, is a repetition of that prefixed to the earlier part of the work, and declares that it makes "known in a single chapter the chapters relating to going forth from day." According to certain papyri, it was "discovered" either in the reign of Usaphaes of the First Dynasty or in that of Men-kau-Ra of the Fourth Dynasty, under the feet of Thoth in the temple of Eshmunên, written in letters of lapis-lazuli on a tablet of alabaster. The details of the "discovery" are not sufficiently uniform to allow us to put much confidence in them; the tradition proves, however, that the Egyptians considered the chapter to be at least as old as the Fourth Dynasty; and the belief is supported by the fact that on the monuments of the Eleventh Dynasty it is already an integral part of the book. If, then, a chapter which is relatively modern was nevertheless embodied in the book in the age of the earlier dynasties, we can gain some idea of the antiquity to which the book itself must reach back, even in its composite form.¹

The first fifteen chapters, as Champollion perceived, form a complete whole in themselves. In the Theban texts they are called the "Chapter of going before the

divine tribunal of Osiris.” In the Saite period this is replaced by the more general title of “Beginning of the Chapter of going forth from day.”

They describe how the soul can leave its mummy, can escape forced labour in the other world through the help of the ushebti, can pass in safety “over the back of the serpent Apophis, the wicked,” and can acquire that “correctness of voice” which will enable it to repeat correctly the words of the ritual, and so enter or leave at will the world beyond the grave. The 15th chapter is a hymn to the Sun.

The 17th chapter begins a new section. It sums up in a condensed form all that the soul was required to know about the gods and the world to come. But it has been glossed and reglossed until its first form has become almost unrecognisable. The commentary attached to the original passages became in time itself so obscure as to need explanation, and the chapter now consists of three strata of religious thought and exposition piled one on the top of the other. As it now stands it unites in a common goal the aspirations of the followers of Osiris and of those of the solar cult; the dead man is identified with the gods, and so wends his way to the divine land in which they dwell, whether that be the fields of Alu or the bark of the Sun.

The chapters which follow are intended to restore voice, memory, and name to the dead man. With the restoration of his name comes the restoration of his individuality, for that which has no name has no individuality. Then follows (in chapters xxvi.–xxx.) the restoration of his heart, which is regarded first as a mere organ of the body, and then in the Osirian sense as the

\[1\] Various interpretations have been given of the phrase *per m hru*. I have adopted that which seems to me most consonant with both grammar and logical probability.
equivalent of the conscience. As an organ, the figure of a heart placed in the tomb was sufficient to ensure its return; as the living conscience and principle of life, something of a more mysterious and symbolic nature was needed. This was found in the scarab or beetle, whose name kheper happened to coincide in sound with the word that signified "to become."¹

In a series of chapters the soul is now protected against the poisonous serpents, including "the great python who devours the ass," which it will meet with in its passage through the limbo of the other world. As Professor Maspero remarks, the large place occupied by these serpents among the dangers which await the soul on its first exit from the body, make it plain that in the days when the Book of the Dead was first being compiled, venomous snakes were far more plentiful than they ever have been in the Egypt of historical times. Indeed, the python, whose huge folds are still painted on the walls of the royal tombs of Thebes, had retired southward long before the age of the Fourth Dynasty. To an equally early period we may refer the forty-second chapter, in which the soul is taught how to escape the slaughter of the enemies of Horus, which took place at Herakleopolis.

¹ The inscribed scarab does not seem to be older than the age of the Eleventh Dynasty, when it began to take the place of the cylinder as a seal. At all events there is no authentic record of the discovery of one in any tomb of an earlier date, and the scarabs with the names of Neb-ka-ra, Khufu, and other early kings, were for the most part made in the time of the Twenty-sixth Dynasty. It is possible, however, that some at least of the scarabs which bear the name of Ra-n-ka of the Eighth Dynasty are contemporaneous with the Pharaoh whose name is written upon them. If so, they are the oldest inscribed scarabs with which we are acquainted. Uninscribed scarabs, however, go back to the prehistoric age. The use of the scarab as an amulet is already referred to in the Pyramid texts. And Dr. Reisner has discovered green porcelain beetles in the prehistoric graves of Negadiyâ, along with other green porcelain amulets, such as turtles, etc.
during the Osirian wars,—a chapter, however, in which, it may be observed, the elder Horus is already confounded with the son of Osiris.

Chapters xliv. to liii. are occupied in describing how the dead man is thus preserved from "the second death." Illustrations are drawn both from the punishments undergone by the enemies of the sun-god in the story of his passage through the world of night, and from the old beliefs connected with the lot of the Ka. He was neither to be beheaded, nor cast head downwards into the abyss, nor was he to feed on filth like the Ka for which no offerings of food had been provided. The dangers from which he is thus preserved are next contrasted with the joys that await him in the paradise of the Blest (chs. liv.—lxiii.).

The 64th chapter, which sums up the preceding part of the book, and constitutes a break between it and what follows, has already been considered. The ten chapters which succeed it are all similarly concerned with "coming forth from the day." They thus traverse the same ground as the first fifteen chapters of the book, but they deal with the subject in a different way and from a different point of view. They are a fresh proof of the composite character of the work, and of the desire of its authors to incorporate in it all that had been written on the future life of the soul up to the time of its composition. Professor Maspero believes that they embody the various formulae relating to the severance of soul and body which were current in the priestly schools.

Equally separate in tone and spirit are the next six chapters (lxxv.—xc.), which have emanated from the school of Heliopolis. They deal with the destiny of the

1 As is also the case in the Pyramid texts.
2 Maspero, Études de Mythologie et d'Archéologie, p. 369.
Ba or "soul" rather than with that of the Osirian, and describe the transformations which it can undergo if fortified with the words of the ritual. It may at will transform itself into a hawk of gold, a lotus flower, the moon-god or Ptah, even into a viper, a crocodile, or a goose. But first it must fly to Heliopolis and the solar deities who reside there, and it is in Heliopolis that its transformation into the god Ptah is to take place.

The next chapter, the 91st, transports us into a different atmosphere of religious thought. It deals with the reunion of the soul and the body. But the two which follow forbid the Egyptian to believe that this meant a sojourn of the soul in the tomb. On the contrary, the soul, it is said, is not to be "imprisoned"; while the 93rd chapter "opens the gates of the sepulchre to the soul and the shadow (khaib), that they may go forth and employ their limbs." And the land to which they were to go was a land of sunlight.

From this point onwards the Book of the Dead is purely Osirian in character. But beliefs derived from the solar cult have been allowed to mingle with the Osirian elements; thus the bark of the sun-god has been identified with the bark which carried the Osirian dead to the fields of Alu, and Osiris is even permitted to assign a place to his faithful servants in the boat of Ra instead of in the paradise over which he himself rules. And the Osirian elements themselves belong to two different periods or two different schools of thought. In the earlier chapters the paradise of Osiris is gained like the paradise of Ra, by the magical power of the words of the ritual and the offerings made by the friends of the dead; from the 125th chapter onwards the test of righteousness is a moral one; the dead man has to be acquitted by his conscience and the tribunal of Osiris before he can enter into everlasting bliss.
The bark which carried the followers of Osiris has been explained by the Pyramid texts. When the dead man had ascended to heaven, either by the ladder which rose from the earth at Hermopolis or in some other way, he found his path barred by a deep lake or canal. According to one myth, he was carried across it on the wings of the ibis Thoth, but the more general belief provided for him the boat of the ferryman Nu-Urru, the prototype of the Greek Charon. The fusion of the Osirian creed with the solar cult, however, caused the boat of Nu-Urru and the bark of the sun-god to be confounded together, and accordingly three chapters (c.-cii.) have been added to that in which the boat of the Egyptian Charon is referred to, "in order to teach the luminous spirit (khu) how to enter the bark among the servants of Ra." In the next chapter, Hathor, "the lady of the west," is the object of prayer.

Two chapters (cv. and cvi.) are now interpolated from the ritual of Ptah. They take us back to the age when offerings were made to the ka of the dead and not to the gods, and declare that abundant food should be given it "each day in Memphis." They have little to do with the destinies of the Osirian in the paradise of Alu. These are once more resumed in the 107th chapter: the fields of Alu are described, and the life led by those who enjoy them.

With the 125th chapter we enter the "Hall of the Two Truths," where Osiris sits on his throne of judgment, and the soul is justified or condemned for the deeds it had done in the flesh. It is no longer ceremonial, but moral purity that is required: the follower of Osiris is

1 Maspero, "La Pyramide de Pepi 1er" in Recueil de Travaux, vii. pp. 161, 162. In the Babylonian Epic of Gilgames the place of Nu-Urru is taken by Ur-Ninnu.
to be saved not by the words and prayers of the ritual, however correctly they may be pronounced, but by his acts and conduct in this lower world. We are transported into a new atmosphere, in which religion and morality for the first time are united in one: the teaching of the prophet has taken the place of the teaching of the priest.

All the blessings promised to the disciples of other creeds than the Osirian are now granted to the soul who has passed unscathed through the hall of judgment. Not only the fields of Alu are his, but the solar bark as well, to which the school of Heliopolis looked forward; even the old belief which confined the Ka to the narrow precincts of the tomb was not forgotten, and the 132nd chapter instructs the Osirian how to "wander at will to see his house." Like Osiris himself, he can take part in the festival of the dead, and share in the offerings that are presented at it. Free access is allowed him to all parts of the other world: whatever heaven or hell had been imagined in the local sanctuaries of Egypt was open to him to visit as he would.

The later chapters of the Book of the Dead take us back to the earth. They are concerned with the mummy and its resting-place, with the charms and amulets which preserved the body from decay, or enabled the soul to inspire it once more with life. They form a sort of appendix, dealing rather with the beliefs and superstitions of the people, than with the ideas of the theologians, about the gods and the future life.¹

The order in which I have referred to the chapters of the book are those of the Theban texts as edited by Dr. Naville. But it must not be supposed that it con-

¹ The Book of the Dead has been analysed by Maspero, Études de Mythologie et d'Archéologie égyptiennes, i. pp. 325-387.
stitutes an integral part of the original work. As a matter of fact there are very few copies of the book, even among those which belong to the Theban period, in which anything like all the chapters is to be found. Indeed, it is difficult to say how many chapters a complete edition of it ought to contain. Pierret made them one hundred and sixty-five; the latest editors raise them to over two hundred. The reason of this is easy to explain. The separate chapters are for the most part intended for special purposes or special occasions, and each, therefore, has had a separate origin. They have been collected from all sides, and thrown together with very little attempt at arrangement or order. They belong to different periods of composition and different schools of religious thought: some of them mount back to the remotest antiquity, others are probably even later than the foundation of the united monarchy. Hence, as a rule, only a selection of them was inscribed on the rolls of papyrus that were buried with the dead, or on the coffin and sepulchral objects deposited in the tomb; it was only the most important of them that the Osirian was likely to need in the other world. Indeed, in some cases only the semblance of a text seems to have been thought necessary. The copies made for the dead usually abound with errors, and some have actually been found in which the text is represented by a number of unmeaning signs. The Book of the Dead, moreover, was continually growing. The oldest texts are the shortest and most simple, the latest are the longest and most crowded with chapters. As fresh prayers and formulæ for protecting the dead in the other world, or directing them on their journey, were discovered in the local sanctuaries, they were added in the form of chapters; no precaution, it was felt, should be omitted which might secure the safety of those who had passed beyond the grave.
The Book of the Dead was thus a growth, and a growth it remained. It never underwent the systematic revision which has been the lot of most other sacred books. We look in it in vain for traces of an individual editor. And on this account its form and even its language were never fixed. The prayers and formulæ it contained were, it is true, stereotyped, for their success depended on their correct recitation; but beyond this the utmost latitude was allowed in the way of addition or change. A Masoretic counting of words and syllables would have been inconceivable to the Egyptian.

In later days, more especially in the Greek period, the Book of the Dead served as a basis for other religious compositions which claimed divine authorship, and the authority due to such an origin. Of these the most popular was the Book of Respiration (Shā-n-Sensenu), which derives its inspiration from chapters liv. to lxiii. of the Book of the Dead, and is ascribed to the god Thoth. In anticipation of the apocalyptic literature of the Jews, the writer describes the condition of the soul in the next world, following closely the indications of the old ritual, and declaring how the "Respirations" it contains were first "made by Isis for her brother Osiris to give life to his soul, to give life to his body, to rejuvenate all his members anew." The soul of the Osirian is said to "live" by means of the book that is thus provided for him, for he "has received the Book of Respiration, that he may breathe with his soul . . . that he may make any transformation at his will . . . that his soul may go wherever it desireth."¹ We are reminded in these words of the last chapter of the Book of Revelation (xxii. 7, 18, 19).

¹ Translated by P. J. de Horrack.
ever other articles of belief he may have held, the Egyptian of the historical age was before all things else a follower of Osiris. It was as an Osirian that he hoped to traverse the regions that lay beyond the tomb, and whose geography and inhabitants were revealed to him in the Osirian ritual. From this point of view, accordingly, the Book of the Dead may be termed the Bible of the Egyptians. But it was not without rivals. We have seen that even in the Book of the Dead the heaven of Osiris is not the only heaven to which the dead may look forward. Osiris has a rival in the sun-god, and a place in the solar bark seems almost as much coveted as a place in the fields of Alu. The solar cult of Heliopolis had indeed to yield to the more popular cult of Osiris, but it was on condition that the cult of Osiris recognised and admitted it. To be a follower of Osiris did not prevent the believing Egyptian from being also a follower of the god Ra.

In the latter part of the Theban period the solar cult received a fresh impulse and developed a new life. The attempt of Khu-n-Aten to establish a new faith, the outward symbol of which was the solar disc, was but an indication of the general trend of religious thought, and the Asiatic conquests of the Eighteenth Dynasty introduced into Egypt the worship and creed of the sun-god Baal. One by one the gods were identified with Ra; Amon himself became Amon-Ra, and the local deity of Thebes passed into a pantheistic sun-god. It was under these conditions that a new ritual was compiled for the educated classes of Egypt, or at all events was adopted by the religion of the State. This was the Book Am Duat, the Book of the Other World.

Copies of it are written on the walls of the dark chambers in the rock-cut labyrinths wherein the kings of the Nineteenth and Twentieth Dynasties were laid to rest.
In the tomb of Seti I. we find two versions, one in which the text is given in full, another in which the usual plan is followed of giving only the last five sections completely, while extracts alone are taken from the first seven. The text is profusely illustrated by pictures, in order that the dead might have no difficulty in understanding the words of the ritual, or in recognising the friends and enemies he would meet in the other world.

Unlike the Book of the Dead, the Book Am Duat is a systematic treatise, which bears the stamp of individual authorship. It is an apocalypse resting on an astronomical foundation, and is, in fact, a minute and detailed account of the passage of the sun-god along the heavenly river Ur-nes during the twelve hours of the night. Each hour is represented by a separate locality in the world of darkness, enclosed within gates, and guarded by fire-breathing serpents and similar monsters. As the bark of the sun-god glides along, the gates are successively opened by the magical power of the words he utters, and their guardians receive him in peace. Immediately he has passed the gates close behind him, and the region he has left is once more enveloped in darkness.

But though he is thus able to illuminate for the brief space of an hour the several regions of the other world, it is not as the living sun-god of day that he voyages along the infernal river, but as "the flesh of Ra"—that is to say, as that mortal part of his nature which alone could die and enter the realm of the dead. The river is a duplicate of the Nile, with its strip of bank on either side, its fields and cities, even its nomes, wherein the god, like the Pharaoh, assigns land and duties to his followers. For the followers of Ra have a very different lot before them from that which awaited the followers of Osiris. There was no land of everlasting light and happiness to
which they could look forward, nor was their destiny hereafter dependent on their conduct in this life. Their supreme end was to accompany the sun-god in his bark as he passed each night through the twelve regions of the dead, and this could be attained only by a knowledge of the ritual of Am Duat and the mystic formulœ it contained. Few, however, of those who started with the sun-god on his nocturnal voyage remained with him to the last; most of them were stopped in the regions through which he passed, where fields were granted them whose produce they might enjoy, and where each night for a single hour they formed as it were a bodyguard around the god and lived once more in the light. Even the kings of Upper and Lower Egypt were condemned to dwell for ever in this gloomy Hades, along with Osiris and the Khû or luminous souls of an earlier faith. Those who were happy enough by virtue of their knowledge and spells to emerge with Ra into the dawn of a new day, henceforth had their home in the solar bark, and were absorbed into the person of the god.

But it was not only the friends and followers of Ra who thus accompanied him in his journey through the other world; his enemies were there also, and the horrible punishments they had to endure, as depicted on the walls of the royal tombs, were worthy of the imagination of a Dante. The banks of the infernal river were lined with strange and terrible monsters, some of them the older deities and spirits of the popular creed, others mere creations of symbolism, others creatures of composite form to whose invention the older mythology contributed. Fire-breathing serpents are prominent among them, lighting up the darkness for the friends of Ra, and burning his foes with their poisonous flames.¹

¹ For a translation and analysis of the Book of Am Duat, see Maspero, Études de Mythologie et d'Archéologie égyptiennes ii. pp. 1-163.
The artificial character of this picture of the other world is clear at the first glance. With the pedantic attention to details which characterised the Egyptian, every part of it has been carefully elaborated. The names and forms of the personages who stand on the banks of the infernal river or enter the boat of Ra, as with each successive hour he passes into a new region, are all given; even the exact area of each region is stated, though the measurements do not agree in all the versions of the book. But the best proof of its artificial nature is to be found in a fact first pointed out by Professor Maspero. Two of the older conceptions of the other world and the life beyond the grave, which differed essentially from the solar doctrine, are embedded in it, but embedded as it were perforce. In the fourth and fifth hours or regions we have a picture of the future life as it was conceived by the worshippers of Sokaris in the primitive days of Memphis; in the sixth and seventh, the tribunal and paradise of Osiris.

The kingdom of Sokaris represented that dreary conception of an after-existence which was associated with the *ka*. Like the mummy, the *ka* was condemned to live in the dark chamber of the tomb, whence it crept forth at night to consume the food that had been offered to it, and without which it was doomed to perish. Long before the age when the Book of Am Duat was written, this primitive belief had passed away from the minds of men; but the tradition of it still lingered, and had secured a permanent place in the theological lore of Egypt. It has accordingly been annexed as it were by the author of the book, and transformed into two of the regions of the night through which the solar bark has to pass. But the terms in which the kingdom of Sokaris had been described were too stereotyped to be ignored or altered, and the solar bark is accordingly made to pass
above the primitive Hades, the voices of whose inhabitants are heard rising up in an indistinct murmur though their forms are concealed from view. A memory is preserved even of the sandy desert of Giza and Saqqâra, where the inhabitants of Memphis were buried, and over which Sokarîs ruled as lord of the dead. The realm of Sokarîs is pictured as an enclosure of sand, flanked on either side by a half-buried sphinx.

The author of the Book of Am Duat has dealt with the heaven of Osiris as he has done with the Hades of Sokarîs. Osiris and his paradise have been transported bodily to the nocturnal path of the sun-god, and condemned to receive what little light is henceforth allowed them from the nightly passage of the solar bark. Thoth guides the bark to the city which contains the tomb of Osiris, that mysterious house wherein are the four human forms of the god. On the way the serpent Neha-hir has to be overcome; he is but another form of the serpent Apophis, the enemy of Ra, who thus takes the place of Set, the enemy of Osiris. When the sixth region is passed, which is a sort of vestibule to the "retreat" of Osiris in the seventh, other enemies of Osiris —of whom, however, the Osirian doctrine knew but little—are being put to death in true solar fashion. Perhaps the most noteworthy fact in this description of the kingdom of Orisis is, that not only all the gods of the Osirian cycle are relegated to it, including the hawk Horus, but also the Khû or luminous manes and the ancient kings of Upper and Lower Egypt. The fact points unmistakably to the great antiquity of the Osirian creed. It went back to a time when as yet the Egyptian monarchy was not united, and when the khû or luminous soul held the same place in Egyptian thought as had been held at an earlier time by the ka and later by the soul or ba. So undoubted was the
fact that the old Pharaohs of primeval Egypt had died in the Osirian faith, that the author of the Book of Am Duat could not disregard it; he was forced to place the predecessors of a Seti or a Ramses, for whom the book was copied, in one of the murky regions of the other world instead of in the solar bark. They had been followers of Osiris and not of Ra, and there was accordingly no place for them in the boat of the sun-god.

Osiris is thus subordinated to the sun. The god of the dead is not allowed to rule even in his own domains. Such light and life as are graciously permitted to him come from the passing of the solar bark once in each twenty-four hours. He has lost the bright and happy fields of Alu, he has had to quit even the judgment-hall where he decided the lot of man. Osiris and his creed are deposed to make way for another god with another and a lower form of doctrine.

The fact was so patent, that a second solar apocalypse was written in order to smooth it away. This was the Book of the Gates or of Hades, a copy of which is also inscribed in the tomb of Seti. It differs only in details from the Book Am Duat; the main outlines of the latter, with the passage of the solar bark through the twelve hours or regions of the night, remain unaltered. But the details vary considerably. The gates which shut the hours off one from the other become fortified pylons, guarded by serpents breathing fire. The Hades of Sokaris is suppressed, and the judgment-hall of Osiris is introduced between the fifth and sixth hours. The object of the judgment, however, seems merely the punishment of the enemies of the god, who are tied to stakes and finally burned or otherwise put to death in the eighth hour. Among them appears Set in the form of a swine, who is driven out of the hall of judgment by a cynocephalous ape. As for the righteous,
they are still allowed to cultivate the fields of the kingdom of Osiris; but it is a kingdom which is plunged in darkness except during the brief space of time when the bark of the sun-god floats through it. Osiris, nevertheless, is acknowledged as lord of the world of the dead, in contradistinction to the Book Am Duat, which assigns him only a portion of it; and when the sun-god emerges into the world of light at the end of the twelfth hour, it is by passing through the hands of Nut, the sky, who stands on the body of Osiris, "which encircles the other world." Nor is the serpent Apophis, the enemy of Ra, confounded with Set; his overthrow by Tum takes place in the first hour, before the tribunal of Osiris is reached.

The theology of the two books resembles the Taoism of China in its identification of religion with the knowledge of magical formulae. The moral element which distinguished the Osirian faith has disappeared, and salvation is made to depend on the knowledge of a mystical apocalypse. Only the rich and cultivated have henceforth a chance of obtaining it. And even for them the prospect was dreary enough. A few—the innermost circle of disciples—might look forward to absorption into the sun-god, which practically meant a loss of individuality; for the rest there was only a world of darkness and inaction, where all that made life enjoyable to the Egyptian was absent. The author of the Book of the Gates gives expression to the fact when he tells us that as the last gate of the other world closes behind the sun-god, the souls who are left in darkness groan heavily. To such an end had the learned theology of Egypt brought both the people and their gods!

We need not wonder that under the influence of such teaching the intellectual classes fell more and more into a hopeless scepticism, which saw in death the loss of all that we most prize here below. On the one side,
we have sceptical treatises like the dialogue between the jackal and the Ethiopian cat, where the cat, who represents the old-fashioned orthodoxy, has by far the worst of the argument;¹ on the other side, the dirge on the death of the wife of the high priest of Memphis, which I have quoted in an earlier lecture—

"The underworld is a land of thick darkness,
A sorrowful place for the dead.
They sleep, after their guise, never to awaken."

It was better, indeed, that it should be so than that they should awaken only to lead the existence which the Book of Am Duat describes.

How far the doctrines of the solar theology extended beyond the narrow circle in which they originated, it is difficult to say. In the nature of the case they could not become popular, as they started from an assumption of esoteric knowledge. We know that the majority of the Egyptians continued to hold to the Osirian creed up to the last days of paganism—or at all events they professed to do so—and as long as the Osirian creed was retained the moral element in religion was recognised. In one respect, however, the solar theology triumphed. The gods of Egypt, including Osiris himself, were identified with the sun-god, and became forms or manifestations of Ra. Egyptian religion became pantheistic; the divinity was discovered everywhere, and the shadowy and impersonal forms of the ancient deities were mingled together in hopeless confusion. It seemed hardly to matter which was invoked, for each was all and all were each.

Gnosticism was the natural daughter of the solar theology. The doctrine that knowledge is salvation and

¹ Revue égyptologique, i. 4, ii. 3 (1880, 1881), where an account of the demotic story is given by E. Révillout.
that the gods of the popular cult are manifestations of the sun-god, was applied to explain the origin of evil. Evil became the result of imperfection and ignorance, necessarily inherent in matter, and arising from the fact that the creation is due to the last of a long series of æons or emanations from the supreme God. The æons are the legitimate descendants of the manifold deities whom the Egyptian priests had resolved into forms of Ra, while the identification of evil with the necessary imperfection of matter deprives it of a moral element, and finds a remedy for it in the gnosis or "knowledge" of the real nature of things. Even the strange monsters and symbolic figures which play so large a part in the solar revelation are reproduced in Gnosticism. Abraxas and the other curiously composite creatures engraved on Gnostic gems have all sprung from the Books of Am Duat and the Gates, along with the allegorical meanings that were read into them. However much the solar school of theology may have been for the old religion of Egypt a teaching of death, in the Gnosticism of the first Christian centuries it was born anew.
LECTURE IX.

THE POPULAR RELIGION OF EGYPT.

Thus far I have dealt with the official religion of ancient Egypt, with the religion of the priests and princes, the scribes and educated classes. This is naturally the religion of which we know most. The monuments that have come down to us are for the most part literary and architectural, and enshrine the ideas and beliefs of the cultivated part of the community. The papyri were written for those who could read and write, the temples were erected at the expense of the State, and the texts and figures with which they were adorned were engraved or painted on their walls under priestly direction. The sculptured and decorated tomb, the painted mummy-case, the costly sarcophagus, the roll of papyrus that was buried with the dead, were all alike the privilege of the wealthy and the educated. The grave that contained the body of the poor contained little else than the coarse cere-cloths in which it was wrapped. Our knowledge, therefore, of the religion of the people, of the popular religion as distinguished from the religion of official orthodoxy, is, and must be, imperfect. We have to gather it from the traces it has left in the religion of the State, from stray references to it in literature, from a few rare monuments which have come down to us, from its survivals in the modern folk-lore and superstitions of Egypt, or from its influence on the decaying faith of the classical age.
There was, however, a popular religion by the side of the official religion, just as there is in all countries which possess an organised faith. And if it is difficult to understand fully the religion of the uneducated classes in Western Europe to-day, or to realise their point of view, it must be much more difficult to do so in the case of ancient Egypt. Here our materials are scanty, and the very fact that we know as much as we do about the religion of the upper class makes it additionally harder to estimate them aright.

A considerable portion of the fellahin were descended from the earlier neolithic population of Egypt, whom the Pharaonic Egyptians found already settled in the country. In a former lecture I have endeavoured to show that they were fetish-worshippers, and that among their fetishes animals were especially prominent. They had no priests, for fetishism is incompatible with a priesthood in the proper sense of the term. Neither did they embalm their dead; all those beliefs and ideas, therefore, which were connected with a priesthood and the practice of embalming must have come to them from without; the gods and sacerdotal colleges of the State religion, the Osirian creed, and the belief in the resurrection, must have been for them of foreign origin. And of foreign origin they doubtless remained to the bulk of the nation down to the last days of paganism.

Amon and Ra and Osiris were indeed familiar names, the temple festivals were duly observed, and the processions in honour of the State gods duly attended; and after the age of the Eighteenth Dynasty, when the fusion between the different elements in the population was completed, the practice of mummification became general; but the names of the State gods were names only, to which the peasant attached a very different meaning from that which official orthodoxy demanded. He still worshipped
the tree whose shady branches arose on the edge of the desert or at the corner of his field, or brought his offerings to some animal, in which he saw not a symbol or an incarnation of Horus and Sekhet, but an actual hawk and cat.

How deeply rooted this belief in the divinity of animals was in the minds of the people, is shown by the fact that the State religion had to recognise it just as Mohammed had perforce to recognise the sanctity of the "Black Stone" of the Kaaba. As we have seen, the second king of the Second Thinite Dynasty is said to have legalised the worship of the bull Apis of Memphis, Mnevis of Heliopolis, and the ram of Mendes; and though the official explanation was that these animals were but incarnations of Ptah and Ra to whom the worship was really addressed, it was an explanation about which the people neither knew nor cared. The divine honours they paid to the bulls and ram were paid to the animals themselves, and not to the gods of the priestly cult.

Here and there a few evidences have been preserved to us that such was the fact. In the tomb of Ra-zeserkaseneb, for instance, at Thebes, the artist has introduced a picture of a peasant making his morning prayer to a sycamore which stands at the end of a corn-field, while offerings of fruit and bread and water are placed on the ground beside it.¹ The official religion endeavoured to legalise this old tree worship much in the same way as Christianity endeavoured to legalise the old worship of springs, by attaching the tree to the service of a god, and seeing in it one of the forms in which the deity manifested himself. Thus "the sycamore of the south" became the body of Hathor, whose head was

¹ Scheil, "Tombeaux thébains" in Mémoires de la Mission archéologique française du Caire, v. 4, pl. 4.
depicted appearing from its branches, while opposite Siût it was Hor-pes who took the goddess's place. Like other beliefs and practices which go back to the neolithic population of Egypt, the ancient tree worship is not yet extinct. On either side of the Nile sacred trees are to be found, under which the offering of bread and water is still set, though the god of the official cult of Pharaonic Egypt, to whom the worship was nominally paid, has been succeeded by a Mohammedan saint. By the side of the tree often rises the white dome of the tomb of a "shêkh," to whom the place is dedicated, reminding us of a picture copied by Wilkinson in a sepulchre at Hu, in which a small chapel, representing the tomb of Osiris, stands by the side of a tree on whose branches is perched the *bennu* or *phœnix.* The most famous of these trees, however, that of Matariya, is an object of veneration to the Christian rather than to the Mohammedan. The Holy Family, it is said, once rested under its branches during their flight into Egypt; in reality it represents a sycamore in which the soul of Ra of Heliopolis must have been believed to dwell.

Professor Maspero has drawn attention to certain stelae in the museum of Turin, which show how, even in the lower middle class, it was the animal itself and not the official god incarnated in it that was the object of worship. On one of them, which belongs to the age of the Eighteenth Dynasty, huge figures of a swallow and a cat are painted, with a table of offerings standing before them, as well as two kneeling scribes, while the accompanying inscriptions tell us that it was to "the

---

1 So in the Pyramid texts (*Unas* 170) reference is made to "the bœqt," or "ben-nut tree which is in On." The tree is the *Moringa apleura* Gærtner, from the fruit of which the myrobalanum oil was extracted (Joret, *Les Plantes dans l'Antiquité et au Moyen Age*, i. pp. 133, 134).

2 *Ancient Egyptians*, iii. p. 349. The *bennu* is described as "the soul of Osiris."
good” swallow and the “good” cat, and not to any of the State gods who may have hidden themselves under these animal forms, that flowers were being offered and prayers made. On another stela we find two pet cats, who are sitting on a shrine and facing one another, and whom their mistresses—two of the women who wailed at funerals—adore in precisely the same language as that which was used of Osiris or Amon.¹ In the quarries north of Qurna is a similar representation of a cow and a cobra, which stand face to face with a table of offerings between them, while a worshipper kneels at the side, and a half-obiterated inscription contains the usual formulæ of adoration.² Still more curious is a stela, now in the museum of Cairo, on which an ox is represented inside a shrine, while underneath it is a Greek inscription declaring that the “Kretan” who had dedicated the monument could interpret dreams, thanks to the commandment of “the god.” The god, it will be noticed, is not Apis, but an ordinary ox.

But of all the animals who thus continued to be the real gods of the people in spite of priestly teaching and State endowments, none were so numerous or were so universally feared and venerated as the snakes. The serpent was adored where Amon was but a name, and where Ra was looked upon as belonging, like fine horses and clothes, to the rich and the mighty. The prominence

¹ Études de Mythologie et d’Archéologie, ii. p. 395 sqq.
² The influence of the State religion is visible in the picture, as the cow has the solar disc between its horns, and the cobra is crowned not only with horns, but also with the solar disc. Behind the cobra is the leafy branch of a tree. There is no reason for supposing with Wiedemann (Muséon, 1884) that the monument is Ethiopian: what is decipherable in the inscription is purely Egyptian. Professor Wiedemann calls the animal on the left a ram, but my drawing made it a cow. At the feet of the cow, which has a garland round the neck, are two vases.
of the serpent in Egyptian mythology and symbolism indicates how plentiful and dangerous it must have been in the early days of Egypt, and what a lasting impression it made upon the native mind. When the banks of the Nile were an uninhabitable morass, and the neolithic tribes built their huts in the desert, the snake must indeed have been a formidable danger. The most deadly still frequent the desert; it is only in the cultivated land that they are comparatively rare. In Egypt, as elsewhere, the cultivation of the soil and the habits of civilised life have diminished their number, and driven them into the solitudes of the wilderness. But when the Pharaonic Egyptians first arrived in the valley of the Nile, when the swamps were being drained, the jungle cleared away, and the land sown with the wheat of Babylonia, the serpent was still one of the perils of daily life. A folk-tale which has been appropriated and spoilt by the priestly compilers of the legend of Ra, tells how the sun-god was bitten by a venomous snake which lay in his path, and how the poison ran through his veins like fire. The symbol of royalty adopted by the earliest Pharaohs was the cobra; it symbolised the irresistible might and deadly power of the conquering chief-tain which, like the dreaded cobra of the desert, overcame the inhabitants of the country, and compelled them to regard him with the same awe and terror as the serpent itself.

Down to the last the embalmers and gravediggers and others who had to attend to the funeral arrangements of the dead, and consequently lived in the neighbourhood of the necropolis, were more exposed to the chances of snake-bite than the inhabitants of the cultivated land. The necropolis was invariably in the desert, and the nature of their occupation obliged them to excavate the sand or visit the dark chambers of the dead where the
snake glided unseen. It is not surprising, therefore, that the veneration of the snake was especially strong among the population of the cemeteries. Those who inhabited the necropolis of Thebes have left us prayers and dedications to the goddess Mert-seger, who is represented as a cobra or some equally deadly serpent, though at times she is decently veiled under the name of an official deity. Once her place is taken by two snakes, at another time by a dozen of them. She was, in fact, the tutelary goddess of the necropolis, and hence received the title of "the Western Crest" — that is to say, the crest of the western hills, where the earliest tombs of Thebes were situated. Professor Maspero has translated an interesting inscription made in her honour by one of the workmen employed in the cemetery. "Adoration to the Western Crest," it begins, "prostrations before her double! I make my adoration, listen! Ever since I walked on the earth and was an attendant in the Place of Truth (the cemetery), a man, ignorant and foolish, who knew not good from evil, I committed many sins against the goddess of the Crest, and she punished me. I was under her hand night and day; while I cowered on the bed like a woman with child, I cried for breath, and no breath came to me, for I was pursued by the Western Crest, the mightiest of all the gods, the goddess of the place; and behold I will declare to all, great and small, among the workmen of the necropolis: Beware of the Crest, for there is a lion in her, and she strikes like a lion that bewitches, and she is on the track of all who sin against her! So I cried to my mistress, and she came to me as a soft breeze, she united herself with me, causing me to feel her hand; she returned to me in peace, and made me forget my troubles by giving me breath. For the Western Crest is appeased when the cry is made to her; — so says Nefer-ab, the justified.
He says: Behold, hear, all ears who live on earth, beware of the Western Crest!" 1

It is clear that Nefer-ab suffered from asthma, that he believed it had been inflicted upon him by the local goddess for some sin he had committed against her, and that he further believed his penitence and cry for help to have induced her to come to him and cure him. And this goddess was a snake. Here, in the necropolis of Thebes, therefore, the snake played the same part as a healer that it did in the worship of Asklépios. It will be remembered that the first temple raised to Æsculapius at Rome was built after a plague, from which the city was supposed to have been delivered by a serpent hidden in the marshes of the Tiber. The serpent that destroys also heals; by the side of Kakodæmon there is also the good snake Agathodæmon.

Mert-seger, the serpent of the necropolis, did not wholly escape the patronage of the State religion. Like the local cults of aboriginal India over which Brahmianism has thrown its mantle, the cult of Mert-seger was not left wholly unnoticed by the organised religion of the State. A chapel was erected to her in the orthodox form, and it is from this chapel that most of the stelæ have come which have revealed the existence of the old worship. In some of them Mert-seger is identified with Mut, or even with Isis; but such an identification was never accepted or understood by her illiterate worshippers. For them she continued to be what she had been to their forefathers, simply a serpent and nothing more. The old faith has survived centuries of Christianity and Mohammedanism in a modified form. Professor Maspero discovered that the local Mohammedan

1 See the very interesting study of Maspero on "La Déesse Miritskro et ses guérisons miraculeuses" in Études de Mythologie et d'Archéologie, ii. pp. 402-419; Recueil de Travaux, ii. p. 109 sqq.
saint, whose tomb is not far from the ancient chapel of Mert-seger, is still believed to work miracles of healing. He has taken the place of the serpent goddess; that is all.¹

The serpent, however, was not always venerated because it was feared. It lived underground, and was thus, in a special sense, the oldest inhabitant of the land, and the guardian of the soil. The Telmessians told Kresus that it was "a child of the earth."² The harmless snakes that frequent the village houses of modern Egypt are still regarded as the "protectors" of the household. The bowl of milk is provided for them as regularly as it once was in Wales for the fairies, and many tales are told of the punishment a neglect of the household harrás or "guardian" will entail. For its poison continues to exist, though held in reserve, and is communicable by other means than the fangs. At Helwân near Cairo, for instance, I was told of one of these guardian snakes which once missed its female mate and supposed it had been killed. Thereupon it crept into the zîr or jar in which water is kept, and poisoned the water in it. But the female having soon afterwards made its appearance, it was observed to glide into a basin of milk, then to crawl along the ground so that the clotted dust might adhere to its body, and again to enter the zîr. As the dust fouled the water, the people of the house knew that the latter must have been poisoned, and accordingly poured it on the ground. In

¹ The Belmore collection of Egyptian antiquities contains several stelae which commemorate the popular worship of the serpent; see Belmore Collection, pls. 7, 8, and 12. In one of them the uræus has the human head of the official deity; in another it stands on the top of a shrine; but on one (given in pl. 7) the worshipper is kneeling before a coluber of great length, which has none of the attributes of the State gods, and whose numerous coils remind us of Apophis.

² Herodotos, i. 78.
this case the snake provided the remedy for the mischief it had the power to cause.\textsuperscript{1}

But the Agathodæmon or serpent guardian of the house not only still survives among the fellahin of Egypt, serpent worship still holds undiminished sway in the valley of the Nile. In a crater-like hollow of the mountain cliff of Shêkh Heridî there are two domed tombs, dedicated not to a Christian or a Mohammedan saint, but to a snake and his female mate. Shêkh Heridî, in fact, is a serpent, and the place he inhabits is holy ground. Pilgrimages are made annually to it, and the festival of the "Shêkh," which takes place in the month that follows Ramadan, is attended by crowds of sailors and other devout believers, who encamp for days together in the neighbourhood of the shrine.

They have no doubt about the miraculous powers possessed by the snake. It is as thick as a man's thigh, and, if treated irreverently, breathes flames of fire into the face of the spectator, who immediately dies. If it is cut in pieces, the pieces reunite of their own accord, and the blood flowing from them marks a spot where gold is hidden in the ground.

Paul Lucas, in the early part of the eighteenth century, tells us that in his time it was called "the angel," and that shortly before his visit to the Nile it had cured a woman of Ekhmîm of paralysis, from which she had suffered for eight years, by simply crawling up into her litter when she was brought to its dwelling-place. Paul Lucas himself was a witness of its supernatural gifts. It was brought to him by the keeper of the shrine when he was visiting a Bey on the opposite side of the river. Suddenly it disappeared, and was nowhere to be found; but a messenger, who was sent post haste

\textsuperscript{1} Sayce, "Serpent Worship in Ancient and Modern Egypt," in the \textit{Contemporary Review}, Oct. 1893.
to the shrine, returned with the information that "the angel was already there, and had advanced more than twenty steps to meet the dervish who takes care of it."  

Norden, a few years later, has a similar tale to relate. He was told that the serpent-saint "never dies," and that it "cures and grants favours to all those who implore its aid and offer sacrifices to it." The cures were effected by the mere presence of the snake, which came in person to those who desired its help. The Christians, he adds, admit the miraculous powers of the Shêkh equally with the Mohammedans, only they explain them as due to a demon who clothes himself in a serpent's form.  

Saint or demon, however, Shêkh Herîdî is really the lineal descendant of a serpent which has been worshipped in its neighbourhood since the prehistoric days of Egypt. A bronze serpent with the head of Zeus Serapis has been found in the mounds of Benâwit, on the western side of the Nile, which face the entrance to the shrine of the Shêkh; and the nome in which the shrine is situated was that of Du-Hefi, "the mountain of the snake." The serpent of Shêkh Herîdî, with his miraculous powers of healing, must thus have been already famous in the days when the nomes of Upper Egypt first received their names. The old neolithic population of the desert must have already venerated the snake that dwelt in the cleft of the rock above which now rises the sacred "tomb" of Shêkh Herîdî.

3 See my article on "Serpent Worship in Ancient and Modern Egypt," in the Contemporary Review, Oct. 1893. On a rock called Hagar el-Ghorâb, a few miles north of Assuan, I have found graffiti of the age of the Twelfth Dynasty, which show that a chapel of "the living serpent" stood on the
The faith of the people dies hard. The gods and goddesses, the theology and speculations of the official religion of Egypt, have passed away, but the old beliefs and superstitions which were already in possession of the land when the Pharaonic Egyptians first entered it, have survived both Christianity and Mohammedanism. The theological systems of Heliopolis or Thebes are like the sacred trees, which, according to Dr. Schweinfurth,\(^1\) were brought from Southern Arabia along with the deities with whose cult they were associated; when the deities themselves ceased to be worshipped, the trees also ceased to be cultivated, and so disappeared from a soil wherein they had been but exotics. But the religion of the great mass of the people remained rooted as it were in the soil, like the palm or the acacia. It flowed like a strong current under the surface of the theology of the State, contemptuously tolerated by the latter, and in its turn but little affected by it. The theology of the State might incorporate and adapt the beliefs of the multitude; to the multitude the State theology was a "tale of little meaning, though the words were strong."

If we would know what the bulk of the people thought of those deities whom the higher classes regarded as manifestations of a single ineffable and omnipotent divine power, we must turn to the folk-tales which were taken up and disfigured by the rationalising priests of a later period, when they combined together in a connected story all that had been said about the gods of the local sanctuaries. Each sanctuary came to possess its euhemer-spot; and a native informed me that the rock is still haunted by a monstrous serpent, "as long as an oar and as thick as a man," which appears at night and destroys, with the fire that blazes from its eyes, whoever is unfortunate enough to fall in its way. See *Recueil de Travaux*, xvi. p. 174.

\(^1\) In the *Verhandlungen der Gesellschaft für Erdkunde zu Berlin*, 1889, No. 7.
ising legend of the chief divinity to whom it was con-
secrated; the divinity was transformed into an earthly
king, and his history was concocted partly out of popular
tales, associated for the most part with particular relics
and charms, partly from forced etymologies of proper
names. At how early a date these artificial legends first
came into existence we do not know, but we already
meet with examples of them in the time of the Nine-
teenth and Twentieth Dynasties. They belong, however,
to the age when the rationalistic process of resolving the
gods into human princes had already begun,—the counter
side of the process that had turned the Pharaoh into a
god,—and their artificial character is betrayed by the
attempt to extract history from learned but unscientific
explanations of the origin of local and other names.

Here, for instance, is one which was compiled for the
temple of the sun-god at Heliopolis, and is contained in
a Turin papyrus of the age of the Twentieth Dynasty:
"Account of the god who created himself, the creator of
heaven, of earth, of the gods, of men, of wild beasts, of
cattle, of reptiles, of fowls, and of fish; the king of men
and gods, to whom centuries are but as years; who
possesses numberless names which no man knoweth, no,
not even the gods.

"Isis was a woman, more knowing in her malice than
millions of men, clever among millions of the gods, equal
to millions of spirits, to whom as unto Ra nothing was
unknown either in heaven or upon earth.

"The god Ra came each day to sit upon his throne; he
had grown old, his mouth trembled, his slaver trickled
down to the earth, and his saliva dropped upon the
ground. Isis kneaded it with her hand along with the
dust that had adhered to it; she moulded therefrom a
sacred serpent, to which she gave the form of a spear-
shaft. She wound it not about her face, but flung it on
the road along which the great god walked, as often as he wished, in his twofold kingdom.

"The venerable god went forth, the (other) gods accompanied him, he walked along as on other days. Then the sacred serpent bit him. The divine god opened his mouth, and his cry rang to heaven. His Ennead of gods called: 'What is it?' and the gods cried, 'Look there!' He could make no answer, his jaws chattered, his limbs shook, the venom took hold of his flesh as the Nile covers its banks (with water).

"When the heart of the great god was quieted, he called to his followers: 'Come to me, ye children of my limbs, ye gods who have emanated from me! Something painful hath hurt me; my heart perceiveth it, yet my eyes see it not; my hand hath not wrought it, nothing that I have made knoweth what it is, yet have I never tasted suffering like unto it, and there is no pain which is worse. . . . I went forth to see what I had created, I was walking in the two lands which I have made, when something stung me which I knew not. Was it fire, was it water? My heart is in flames, my limbs tremble, all my members shiver. Let there be brought unto me the children of the gods of beneficent words, who have understanding mouths, and whose power reaches unto heaven.'

"The children of the gods came, full of woe; Isis came with her magic; with her mouth full of the breath of life, whose recipes destroy pain, whose word gives life to the dead. She said: 'What is it, what is it, O father of the gods? A serpent hath wrought this suffering in thee, one of thy creatures hath lifted up his head against thee. Surely he shall be overthrown by beneficent incantations; I will make him retreat at the sight of thy rays.'

"The holy god opened his mouth: 'I walked along the road, travelling through the two lands of the earth, after
the desire of my heart, that I might see what I had created; then was I bitten by a serpent that I saw not. Is it fire, is it water? I am colder than water, I am hotter than fire, all my limbs sweat, I tremble, my eye is unsteady, I see not the sky, drops roll from my face as in the season of summer.'

"Isis replied to Ra: 'O tell me thy name, father of the gods, then shall he live who is released (from pain) by thy name.' But Ra answers: 'I have created heaven and earth, I have set the hills in order, and made all beings that are thereon. I am he who created the water, and caused the primeval ocean to issue forth. I created the spouse of his (divine) mother. I created the heavens and the secrets of the two horizons, and have ordered the souls of the gods. I am he who illuminates all things at the opening of his eyes; if he closes his eyes, all is dark. The water of the Nile rises when he bids it; the gods know not his name. I make the hours and create the days, I send the year and create the inundation, I make the fire that lives, I purify the house. I am Khepera in the morning, Ra at noon, and Tum at evening."

"The venom departed not, it advanced further, the great god became no better. Then Isis said to Ra: 'Thy name was not pronounced in the words thou hast repeated. Tell it to me and the poison will depart; then shall he live whose name is (thus) named.'

"The poison glowed like fire; it was hotter than the flame of fire. The majesty of Ra said: 'I grant thee leave that thou shouldest search within me, O mother Isis! and that my name pass from my bosom into thine.'

"So the god hid himself from the (other) gods; his everlasting bark was empty. When the moment arrived for extracting the heart (whereon the name was written),
Isis said to her son Horus: 'He must yield up unto thee his two eyes (the sun and moon).'

"So the name of the great god was taken from him, and Isis, the great enchantress, said: 'Depart, O poison, leave Ra: let the eye of Horus go forth from the god and shine out of his mouth. I, I have done it; I throw on the earth the victorious poison, for the name of the great god is extracted from him. Let Ra live and the poison die!' So spake Isis, the great one, the regent of the gods, who knows Ra and his true name.”

The writer of the papyrus adds that the recital of this legend is an excellent charm against the poison of a snake, especially if it is written and dissolved in water, which is then drunk by the patient; or if it is inscribed on a piece of linen, and hung around his neck.¹

The contrast is striking between the introduction to the legend and the euhemeristic spirit that elsewhere prevails in it, and can be explained, even in the case of such disregards of consistency as the Egyptians, only on the supposition that the Ra of folk-lore and the Ra of theology were held to be the same merely in name. Not even a pretence is made of regarding Isis as a goddess; she is simply a common witch, who resorts to magic in order to force Ra to hand over his name and therewith his powers to her son Horus. The virtue of the name, and the power conferred by a knowledge of it, are features common to the folk-lore of most countries. They take us back to that primitive phase of thought which not only identifies the name with the person or thing it represents, but makes it a separate entity with an existence of its own.

The legend of the sun-god of Edfu is equally instruct-

¹The legend was first published by Pleyte and Rossi, "Les Papyrus hiératiques de Turin," pls. 31, 77, 131-8. It was translated by Lefèbvre in the Zeitschrift für Aegyptische Sprache, 1883, pp. 27-33.
ive, though in its present form it is not earlier than the Ptolemaic age. This begins as follows: "In the three hundred and sixty-third year of the reign of Ra-Harmakhis, the ever-living, Ra was in Nubia with his soldiers. Enemies, however, conspired (unu) against him; hence the country has ever since borne the name of the land of Conspirators (Uaua). Then the god Ra went his way in his bark along with his followers, and landed in the nome of Edfu. Here the god Hor-Beḥudet (the winged disc) entered the bark of Ra and said to his father: 'O Harmakhis, I see how the enemy have conspired against their lord.' Then said the Majesty of Ra-Harmakhis to the person of Hor-Beḥudet: 'O son of Ra, exalted one, who hast emanated from me, smite the enemy before thee forthwith.' Hor-Beḥudet flew up to the sun in the form of a great winged disc; on that account he is ever since called the great god, the lord of heaven. He espied the enemy from the sky, he followed them in the form of a great winged disc. Through the attack which he made upon them in front, their eyes saw no longer, their ears heard no longer, each slew his neighbour forthwith, there remained not one alive. Then Hor-Beḥudet came in a many-coloured form as a great winged disc into the bark of Ra-Harmakhis. And Thoth said to Ra: 'Lord of the gods, the god of Beḥudet (Edfu) has come in the form of a great winged disc: from this day forth he shall be called Hor-Beḥudet (Horus of Edfu).’ And he said (again): 'From this day forth the city of Edfu shall be called the city of Hor-Beḥudet.' Then Ra embraced the form of Hor, and said to Hor-Beḥudet: 'Thou makest the water of Edfu (red with blood like) grapes, and thy heart is rejoiced thereat.' Hence this water of Edfu is called (the water of grapes).

"And Hor-Beḥudet said: 'March on, O Ra, and behold thine enemies under thy feet in this land.
When the Majesty of Ra had turned back, and the goddess Astartê with him, he saw the enemy lying on the ground, each extended like a prisoner. Then said Ra to Hor-Behudet: 'That is a suitable life.' Hence the seat of Hor-Behudet has ever since been called the place of the Suitable Life. And Thoth said: 'It was a piercing (deb) of my enemies.' So the nome of Edfu (Deb) has been called ever since by that name. And Thoth said to Hor-Behudet: 'Thou art a great protection' (mâk āa). Great in Protection (āa mâk) accordingly has the sacred bark of Horus been ever since called.

"Then Ra spake to the gods who were with him: 'Let us voyage (khen) in our bark on the Nile; we are rejoiced, for our enemies lie on the ground.' The (canal) in which the great god was has ever since been called the Water of Voyaging (Pe-khen).

"Then the enemies of Ra entered the water: they changed themselves into crocodiles and hippopotamuses. But Harmakhis voyaged on the water in his bark. When the crocodiles and hippopotamuses came up to him, they opened their jaws in order to destroy the Majesty of Harmakhis. Then came Hor-Bebudet with his followers the blacksmiths (mesniu); each held an iron lance and chain in his hand, wherewith he smote the crocodiles and the hippopotamuses. Then three hundred and eighty-one of the enemy were brought to the spot, who had been killed in sight of the city of Edfu.

"And Harmakhis said to Hor-Behudet: 'Let my image be in Southern Egypt, since there it is that the victory was gained' (nekhût āh). So the dwelling-place of Hor-Behudet (at Edfu) has ever since been called the Victorious (Nekht-āh). And Thoth said, when he had seen the enemy lying on the ground: 'Glad are your hearts, O gods of heaven; glad are your hearts, O gods of
earth! Horus the younger is come in peace; he has wrought wonders in his journey which he undertook in accordance with the Book of the Slaying of the Hippopotamus.' Ever since was there (at Edfu) a forge (mesen) of Horus.1

"Hor-Beḥudet changed his form into that of a winged solar disc, which remained there above the prow of the bark of Ra. He took with him Nekheb, the goddess of the south, and Uazit, the goddess of the north, in the form of two serpents, in order to annihilate the enemy in their crocodile and hippopotamus bodies in every place to which he came, both in Southern and in Northern Egypt.

"Then the enemy fled before him, they turned their faces towards the south, their hearts sank within them from fear. But Hor-Beḥudet was behind them in the bark of Ra, with an iron lance and chain in his hand. With him were his followers, armed with weapons and chains. Then beheld he the enemy towards the south-east of Thebes in a plain two schoeni in size."

Here follows an account of the several battles which drove the enemies of Horus from place to place until eventually all Egypt passed under his sway. The first battle, that which took place south-east of Thebes, was at Aa-Zadmi, so called from the "wounds" inflicted on the foe, which henceforth bore the sacred name of Hāt-Ra, "the House of Ra." The second was at Neterkhadu, "the divine carnage," to the north-east of

1 The shrine of Horus, whom the legend here identifies with the son of Osiris, was called Mesen at Edfu. The winged solar disc, which seems to have originated there, is called sometimes "the lord of the city of Beḥudet," sometimes "the lord of the city of Mesen." Beḥudet was formerly read Hud, and it is possible that this was really the pronunciation of the name in later days. At all events it seems to be the origin of the modern Edfu, which, of course, has nothing to do with the verb deb, "to pierce."
Dendera; the third at Hebnu, near Minia, in the nome of the Gazelle; and others followed at Oxyrhynchus or Behnesa, and Herakleopolis or Ahnas, where a twofold Mesen or "Forge" was established. Then the foe were driven through the Delta and defeated at Zaru on its eastern frontier, whence they fled in ships down the Red Sea, but were finally overthrown at Shas-her, near the later Berenikê, at the end of the road that led across the desert from the Nile.

Meanwhile, on the 7th of Tybi, their leader "Set had come forward and cried horribly, uttering curses upon the deed of Hor-Behudet in slaying the enemy. And Ra said to Thoth: 'The horrible one cries loudly on account of what Hor-Behudet has done against him.' Thoth replied to Ra: 'Let the cries be called horrible from this day forward.' Hor-Behudet fought long with Set; he flung his iron at him, he smote him to the ground in the city which henceforward was called Pa-Rehehui (the House of the Twins). When Hor-Behudet returned, he brought Set with him; his spear stuck in his neck, his chain was on his hand; the mace of Horus had smitten him, and closed his mouth. He brought him before his father Ra.

"Then Ra said to Thoth: 'Let the companions of Set be given to Isis and Horus her son, that they may deal with them as they will.' . . . So Horus the son of Isis cut off the head of Set and his confederates before his

1 "The City of the Twins" seems to be the same as Ḫa-Zaui, "the House of the Twins," which Dümichen identifies with the Greek Khnubis, close to Esna. An inscription at Esna says that it was also termed Pa-Sahura, "the House of Sahura" (of the Fifth Dynasty), a name which Dümichen finds in that of the modern village of Sahera, south of Esna. On a prehistoric slate found at Abydos the name of the city appears to be indicated by the figures of two twins inside the cartouche of a town (de Morgan, Recherches sur les Origines de l'Égypte, i. pl. iii., first register).
father Ra and all the great Ennead. He carried him under his feet through the land, with the axe on his head and in his back."

Set, however, was not slain. He transformed himself into a serpent, and the battles succeeded which ended with the victory at Shas-her in the land of Uaua. After this "Harmakhis came in his bark and landed at Thes-Hor (the Throne of Horus or Edfu). And Thoth said: 'The dispenser of rays who cometh forth from Ra has conquered the enemy in his form (of a winged disc); let him be named henceforward the dispenser of rays who cometh forth from the horizon.' And Ra said to Thoth: 'Bring this sun (the winged disk) to every place where I am, to the seats of the gods in Southern Egypt, to the seats of the gods in Northern Egypt, (to the seats of the gods) in the other world, that it may drive all evil from its neighbourhood.' Thoth brought it accordingly to all places, as many as exist where there are gods and goddesses. It is the winged solar disc which is placed over the sanctuaries of all gods and goddesses in Egypt, since these sanctuaries are also that of Hor-Beḥudet."

The legend is a curious combination of the traditions relative to the conquest of the neolithic population by the Pharaonic Egyptians, of the myth of Osiris, of etymological speculations about the meaning of certain proper names, and of an attempt to explain the origin of the winged solar disc. We may gather from it that the disc was first used as an ornament at Edfu, and that it was believed, like the winged bulls of Assyria, to have the power of preventing the demons of evil from passing the door over which it was placed. Whether, however, this was one of the superstitions of the older people, or whether it was brought by the conquerors from their

1 Naville, Mythe d'Horus, pls. 12-18; Brugsch, Abhandlungen der Götting. gelehr. Akademie, xiv.
Babylonian home, is doubtful; perhaps the fact that the
disc was a symbolic and architectural ornament, and was
confined, so far as we know, to the temples of the official
gods, points in the latter direction. It is otherwise with
the temple relics mentioned in a legend which has been
preserved on a granite shrine of the Ptolemaic epoch,
that long served as a water-trough by the side of the
well at El-Arish. The temple from which it originally
came was that of At-Nebes, the sacred name of the city
of Qesem or Goshen, now Saft el-Henna. The legend
begins by describing the reign of Shu, who fortified At-
Nebes against "the children of Apophis," the Semites of
"the red desert," who came from the East "at nightfall
upon the road of At-Nebes" to invade Egypt. Here he
dwelt in his palace, and from hence he "ascended into
heaven," when he had grown old and the time had come
for him to die. He was succeeded by his son Seb, who
"discussed the history of the city with the gods who
attended him, (and they told him) all that happened
when the Majesty of Ra was in At-Nebes, the conflicts
of the king Tum in this locality, the valour of the
Majesty of Shu in this city . . . (and the wonders that)
the serpent-goddess Ankhet had done for Ra when he
was with her; the victories of the Majesty of Shu,
smiting the evil ones, when he placed her upon his brow.
Then said the Majesty of Seb: 'I also (will place) her
upon my head, even as my father Shu did.' Seb entered
the temple of Aart (Lock of Hair) together with the gods
that were with him; then he stretched forth his hand to
take the casket in which (Ankhet) was; the serpent
came forth and breathed its vapour on the Majesty of
Seb, confounding him greatly; those who followed him
fell dead, and his Majesty himself was burned in that
day. When his Majesty had fled to the north of At-
Nebes, with the fire of the cobra upon him, behold, when
he came to the fields of henna, the pain of his burn was not yet assuaged, and the gods who followed him said unto him: 'Come, let them take the lock (aart) of Ra which is there, when thy Majesty shall go to see it and its mystery, and his Majesty shall be healed (as soon as it is placed) upon thee.' So the Majesty of Seb caused the magic lock of hair to be brought to Pa-Aart (the House of the Lock), for which was made that reliquary of hard stone which is hidden in the secret place of Pa-Aart, in the district of the divine lock of the god Ra; and behold the fire departed from the limbs of the Majesty of Seb. And many years afterwards, when this lock of hair was brought back to Pa-Aart in At-Nebes, and cast into the great lake of Pa-Aart, whose name is the Dwelling of Waves, in order that it might be purified, behold the lock became a crocodile; it flew to the water and became Sebek, the divine crocodile of At-Nebes.”

Inside the shrine is a picture of the two relics, the cobra which adorned the head-dress of the Pharaoh, and the aart or lock of hair which was supposed to give its name to the temple. They were doubtless preserved at At-Nebes, and shown to the faithful as the veritable objects which had proved the bane and the antidote of the god Seb. They introduce us to a side of Egyptian religion which, though essentially characteristic of the popular faith, had also received the sanction of the official creed. The belief in amulets and charms was too deeply engrained in the popular mind to be ignored; they were consequently taken under the patronage of the gods, and a theory was invented to explain their efficacy. Already the later chapters of the Book of the Dead are concerned with the various amulets which were necessary

to the preservation or resuscitation of the body; and even if the latter were regarded as symbolic, they were concrete symbols—symbols, that is to say, which actually possessed the virtues ascribed to them. Just as the name was a concrete entity, expressive of the very essence of the thing to which it was applied, so too the symbol was an entity with a concrete existence of its own. The materialistic tendency of Egyptian thought, added to the fetishism of the earlier stratum of native religion, produced this result. The doctrine of the Ka furnished a theory by which the educated classes could explain the efficacy of the amulet and the active virtues of the symbol. It was the Ka, the spiritual and yet materialised double, of the amulet that worked the charm—that made the scarab, for instance, a substitute for the living heart, or the dad—the symbol of stability—a passport to the other world.\(^1\)

The amulets buried with the dead, the relics preserved in the temples, had originally been the fetishes of the earlier population of Egypt. They hardly changed their character when they became symbols endowed with mysterious properties, or relics of the State gods which still possessed miraculous powers. The peasant might be told in the ritual of Amon: in “the sanctuary of the god clamour is an abomination to him: pray for thyself with a loving heart, in which the words remain hidden; that he may supply thy need, hear thy words and accept thine offering”;\(^2\) but it was a teaching that was far

---

\(^1\) Cf. the 155th chapter of the Book of the Dead: “These words must be spoken over a gilded dad, which is made from the heart of a sycamore and hung round the neck of the dead. Then shall he pass through the gates of the other world.” When this chapter was written, however, the real origin of the dad—a row of four columns—had been forgotten, and it was imagined to represent the backbone of Osiris. We are transported by it into the full bloom of religious symbolism.

above him. When he entered the sanctuary it was to see the processions of the priests and the relics preserved in it, and it was in these relics that he still put his trust. It was not only in Ethiopia that there were moving and speaking statues which elected the king by taking him by the hand; in Thebes itself, under the priestly kings of the Twentieth Dynasty, we find wonder-working statues whose reality was guaranteed by the priesthood. One of them, it was said, was sent to Asia, where it delivered a king’s daughter from the demon that possessed her, and afterwards returned in a moment to Thebes of its own accord; while others answered the questions addressed to them by nodding the head, or even pronounced prophecies regarding the future. Indeed, as we have seen, the old theory of the ka implied that the statue of the dead man could be reanimated in a sense by his spirit; and a text at Dendera speaks of the soul of Hathor descending from heaven as a human-headed-hawk of lapis-lazuli, and uniting itself with her image. The peasant, therefore, might be excused if he remained true to the superstitions and traditions of his ancestors, and left the official religion, with its one ineffable god, to those who were cultured enough to understand it. Like the peasant of modern Italy, he was content with a divinity that he could see and handle, and about whose wonder-working powers he had no doubt. Materialism is the basis of primitive religion; the horizon of primitive man is limited, and he has not yet learnt to separate thought from the senses through which alone his narrow world is known to him. The simple faith of a child often wears a very materialistic form.

LECTURE X.

THE PLACE OF EGYPTIAN RELIGION IN THE HISTORY OF THEOLOGY.

In the preceding lectures I have endeavoured to bring before you the more salient points in the religion of the ancient Egyptians, in so far as they illustrate their conception of the divine. But we must remember that all such descriptions of ancient belief must be approximate only. We cannot put ourselves in the position of those who held it; our inherited experiences, our racial tendencies, our education and religious ideas, all alike forbid it. If the Egyptians of the Theban period found it difficult to understand the ritual of their own earlier history, and misinterpreted the expressions and allusions in it, how much more difficult must it be for us to do so. The most ordinary religious terms do not bear for us the same meaning that they bore for the Egyptians. The name of God calls up other associations and ideas; the very word "divine" has a different signification in the ancient and the modern world among Eastern and Western peoples. In fact, the more literal is our translation of an old religious text, the more likely we are to misunderstand it.

And yet in one sense we are the religious heirs of the builders and founders of the Egyptian temples. Many of the theories of Egyptian religion, modified and transformed no doubt, have penetrated into the theology of Christian Europe, and form, as it were, part of the woof in
the web of modern religious thought. Christian theology was largely organised and nurtured in the schools of Alexandria, and Alexandria was not only the meeting-place of East and West, it was also the place where the decrepit theology of Egypt was revivified by contact with the speculative philosophy of Greece. The Egyptian, the Greek, and the Jew met there on equal terms, and the result was a theological system in which each had his share. In Philo, we are told, we find Moses Platonising; but the atmosphere in which he did so was that of the old Egyptian faith. And what was true of the philosophy of Philo was still more true of the philosophy of Alexandrine Christianity.

You cannot but have been struck by the similarity of the ancient Egyptian theory of the spiritual part of man to that which underlies so much Christian speculation on the subject, and which still pervades the popular theology of to-day. There is the same distinction between soul and spirit, the same belief in the resurrection of a material body, and in a heaven which is but a glorified counterpart of our own earth. Perhaps, however, the indebtedness of Christian theological theory to ancient Egyptian dogma is nowhere more striking than in the doctrine of the Trinity. The very terms used of it by Christian theologians meet us again in the inscriptions and papyri of Egypt.

Professor Maspero has attempted to show that the Egyptian doctrine of the Trinity was posterior to that of the Ennead.¹ Whether this were so or not, it makes its appearance at an early date in Egyptian theology, and was already recognised in the Pyramid texts. Originally the trinity was a triad like those we find in Babylonian mythology. Here and there the primitive triads survived into historical times, like that of Khnum and the two

¹ See above, p. 90.
goddesses of the Cataract. But more frequently the trinity was an artificial creation, the formation of which can still be traced. Thus at Thebes the female element in it was found in Mut, "the mother" goddess, a title of the supreme goddess of Upper Egypt; while Khonsu, the moon-god, or Mentu, the old god of the nome, became the divine son, and so took a place subordinate to that of the local god Amon. Sometimes recourse was had to grammar, and the second person in the trinity was obtained by attaching the feminine suffix to the name of the chief god. In this way Amon-t was grammatically evolved from Amon, and even Ra-t from Ra. Elsewhere an epithet of the god was transformed into his son; at Memphis, for example, Imhotep, "he who comes in peace," a title of Ptah, became his son and the second person in the trinity. Other members of the trinity were fetched from neighbouring cities and nomes; Nit of Sais had Osiris as a husband, and Sekhet of Letopolis and Bast of Bubastis were successively regarded as the wives of Ptah.

The triad consisted of a divine father, wife, and son. It was thus a counterpart of the human family, and belonged to the same order of ideas as that which explained the creation of the world by a process of generation. This was the cosmology of Heliopolis, and it is probable that to Heliopolis also we must ascribe the doctrine of the Trinity. At any rate the doctrine seems to have been solar in its origin. As Tum, the god of sunset, was identical with Khepera, the sun of the morning, and Ra, the sun of the noonday,—all three being but one god under diverse forms,—so the divine father was believed to engender himself in the person of the divine son, and the divine mother to be one with the divine father and son. The divine essence remained necessarily the same, whatever might be the forms or names under which it displayed itself; and the name, it
must be remembered, had for the Egyptian a separate and real existence. The father became the son and the son the father through all time, and of both alike the mother was but another form. It was eternal fatherhood, eternal motherhood, and eternal generation. The development of the doctrine was assisted by that identification of the Egyptian deities with the sun-god which ended in solar pantheism, as well as by the old theory of the ka, of a personality distinguishable from that to which it belonged, identical with that of which it was the double, and yet at the same time enjoying an independent existence of its own.

With the spread of the Osirian form of faith the doctrine of the Trinity became universal throughout Egypt. The organisation of the faith had included the reduction of the cycle of divinities connected with Osiris into a trinity. Thoth and Anubis, Nebhât and Set, were separated from him, and henceforth he was made the head of a triad, in which Isis was the second person, and Horus, the avenger of his father, was the third. How completely the father and son were merged together may be seen from a hymn to Horus which has been translated by Chabas 1—

"The gods are joyous at the arrival of Osiris,
the son of Horus, the intrepid,
the truth-speaking, the son of Isis, the heir of Osiris. The divine chiefs join him,
the gods recognise the omnipotent child himself . . .
the reign of justice belongs to him.
Horus has found his justification, to him is given the title of his father;
he appears with the atef-crown by order of Seb. He takes the royalty of the two worlds,
the crown of Upper Egypt is placed upon his head.
He judges the world as he likes,
heaven and earth are beneath his eye,

1 Records of the Past, first series, ii.
he commands mankind—the intellectual beings, the race of
the Egyptians and the northern barbarians.
The circuit of the solar disc is under his control;
the winds, the waters, the wood of the plants, and all vege-
tables . . .
Sanctifying, beneficent is his name . .
evil flies afar off, and the earth brings forth abundantly
under her lord.
Justice is confirmed by its lord, who chases away iniquity.
Mild is thy heart, O (Osiris) Un-nefer, son of Isis;
he has taken the crown of Upper Egypt; for him is acknow-
ledged the authority of his father in the great dwelling of
Seb;
he is Ra when speaking, Thoth when writing; the divine
chiefs are at rest."

Here Osiris is identified with Horus, and so becomes the
son of his own wife.

The Egyptian trinity has thus grown out of the triad
under the influence of the solar theology, and of the old
conception of a personality which possessed a concrete
form. Once introduced into the Osirian creed, it spread
with it throughout Egypt, and became a distinguishing
feature of Egyptian theology. Along with the doctrines
of the resurrection of the body and of a judgment to come,
it passed into the schools of Alexandria, and was there
thrown into the crucible of Greek philosophy. The
Platonic doctrine of ideas was adapted to the Egyptian
doctrine of personality, and the three persons of the
trinity became Unity, Mind, and Soul—absolute thought,
absolute reason, and absolute energy.¹

But while, on the one hand, there is continuity between
the religious thought of ancient Egypt and the religious
thought of the world of to-day, there is also continuity,
on the other hand, between the religion of Egypt and that
of primitive Babylonia. In the course of these lectures
I have more than once pointed to the fact: the Pharaonic

¹ See Cudworth’s translation of Iamblichus.
Egyptians were of Asiatic origin and they necessarily brought with them the religious ideas of their Eastern home. As we come to know more both of early Babylonian civilisation and of the beginnings of Egyptian history, we shall doubtless discover that the links between them are closer than we at present imagine, and much that is now obscure will become clear and distinct. Meanwhile there is one link which I cannot pass over. Astro-theology once played a considerable part in the religion of the Egyptians. In the historical age it has lost its importance; the stars have been identified with the official deities, who have accordingly absorbed their individual attributes; but echoes of the worship formerly paid to them are still heard in the Pyramid texts. Sahu or Orion is still remembered as a mighty hunter, whose hunting-ground was the plain of heaven, and whose prey were the gods themselves. When he rises, it is said in the Pyramid of Unas, "the stars fight together, and the archers patrol" the sky which drops with rain; the smaller stars which form his constellation pursue and lasso the gods as the human hunter lassoes the wild bull; they slay and disembowel their booty, and boil the flesh in glowing caldrons. The "greater gods" are hunted "in the morning," those of less account at mid-day, the "lesser gods" "at evening, and Sahu refreshes himself with the divine banquet," feeding on their bodies and absorbing "their magic virtues." "The great ones of the sky" launch "the flames against the caldrons wherein are the haunches of the followers" of the gods; the pole-star, "who causes the dwellers in the sky to march in procession round" Orion, "throws into the caldron the legs of their wives." ¹

as that represented on a curious stela found in Darfur, and now in the museum of Constantinople. The whole description takes us back to a period in the history of Egypt long anterior to that of the Pyramids, when the Pharaonic invaders were first beginning to mingle with the older population of the land and become acquainted with its practices. In the days of Unas the real meaning of the expressions handed down by theological conservatism had been forgotten, or was interpreted metaphorically; but they remained to prove that the age when Orion was still an object of worship superior to the gods of heaven was one which went back to the very dawn of Pharaonic history. The cult of the stars must have been brought by “the followers of Horus” from their Asiatic home.¹

The fame of Orion was eclipsed in later days by that of Sopd or Sirius. But this had its reason in the physiographical peculiarities of Egypt. The heliacal rising of Sirius, the Dog Star, that is to say, its first appearance along with the sun, corresponded with the rise of the Nile in Upper Egypt, and accordingly became a mark of time,

¹ Elsewhere in the Pyramid texts the Akhimu-seku or planets of the northern hemisphere are identified with the gods (Unas 218-220); Unas himself rises as a star (Unas 391); Sirius is the sister of Pepi (Pepi 172); while the Khâ or luminous spirits are identified with the planets (Teta 289). We hear of the “fields of the stars” (Unas 419), of the morning star in the fields of Alu (Pepi 80), and of Akhimm, the grammatically-formed wife of Akhim “planet,” who is associated with “Babi, the lord of night” (Unas 645, 646). One of the constellations frequently mentioned in the Pyramid texts is “the Bull of heaven,” which was also an important constellation in early Babylonian astronomy, where the name formed part of an astronomical system; in Unas 421 the “Bull of heaven” is called the An or “column” of Heliopolis. We hear also of “the fresh water of the stars” (Unas 210). With the latter may be compared the goddess Qebhu, or “Fresh Water,” the daughter of Anubis, the primitive god of the dead, who poured forth the liquid from four vases (Pepi 393). With the name of the goddess the symbol of the Antœopolite nome of Upper Egypt is associated.
and the starting-point of the solar year. Its importance therefore was great, not only for the calendar, but also for those agricultural operations upon which the very existence of Egypt depended. We need not wonder, accordingly, if with the settlement of the Pharaonic Egyptians in the valley of the Nile the worship and name of Orion fell more and more into the background, while that of Sirius became pre-eminent. How far back the pre-eminence of Sirius reaches may be gathered from the fact that the twentieth nome of Northern Egypt—that of Goshen—derived its name from a combination of the mummified hawk of Horus and the cone which, as Brugsch first showed,\(^1\) represents the shaft of zodiacal light that accompanies the rising of Sirius before the dawn of day. Sopd or Sirius is thus identified with the dead Horus who presided over Nekhen in Upper Egypt, and preceded Osiris as the god of the dead.\(^2\)

Of the other stars and constellations we do not know much. The Great Bear was called "the haunch of beef," and was at times identified with Set, and made the abode of the souls of the wicked. Not far off was the hippopotamus, which Brugsch would identify with Draco; while among other constellations were to be found the Lion and the Horus-hawk, as well as a warrior armed with a spear.

All over the world the more prominent stars and constellations have received names. But it is only the more prominent and brilliant among them of which this is true. So far as we know, the only people who have ever systematically mapped out the heavens, dividing the stars into groups, and giving to each group a name of its own, were the Babylonians; and it was from the Babylonians that the constellations as known to Greeks and Romans,

\(^1\) In the *Proc. S.E.A.* xv. p. 233.

\(^2\) Or rather, perhaps, was the Osiris of primeval Egypt.
to Hindus, or to Chinese, were ultimately derived. The inference, therefore, is near at hand, that the primitive Egyptians also were indebted for their map of the sky to the same source. And the inference is supported by more than one fact.

On the one side, the names of several of the constellations were the same among both Babylonians and Egyptians. Of this the Twins, Aquarius, or the Family, are examples, while it can hardly be an accident that Orion in both systems of astronomy is a giant and a hunter. "The Bull of heaven" was a Babylonian star, and Jupiter bore the Sumerian name of Gudi-bir, "the Bull of light"; in the Pyramid texts also we have a "Bull of heaven," the planet Saturn according to Brugsch, Jupiter according to Lepsius. Still more striking are the thirty-six Egyptian decans, the stars who watched for ten days each over the 360 days of the ancient Egyptian year, and were divided into two classes or hemispheres, those of the day and those of the night.¹ Not only did the early Chaldean year similarly consist of 360 days; it too was presided over by thirty-six "councillor" stars, half of which were above the earth, while the other half were below it.² Such a coincidence cannot have been accidental; the Babylonian and Egyptian decans must have had the same origin.

But there was yet a further parallelism between the stellar theology of Egypt and that of Babylonia. In

² Hommel, Ausland, 1892, p. 102; Ginzel, Beiträge zur alten Geschichte, i. pp. 12–15. Diodorus (ii. 30) states that the "councillor gods" were only thirty in number; but the list of planetary stations discovered by Hommel in WAT. v. 46, shows that the text must be corrected into thirty-six. Indeed, Diodorus himself adds that every ten days there was a change of constellation, so that in a year of 360 days there must have been thirty-six constellations in all.
both countries the worship of the stars passed into an astro-theology. The official gods were identified with the planets and fixed stars, and the stellar cult of the people was thus absorbed into the State religion. But whereas this astro-theology was characteristic of Babylonia, it has done little more than leave its traces on the historical religion of Egypt. Jupiter, Saturn, and Mars were identified with Horus under different forms, and Mercury with Set, while Venus became “the bark (za) of the phoenix” or soul “of Osiris.” Sirius was made the star of Isis, Orion the star of Osiris. But, like the cult of the stars itself, this astro-theology belongs to a far-off age in Egyptian history. It is the last faint reflection of a phase of religious thought which had passed away when the monumental records first begin.

It is the same with a curious echo of ancient Babylonian cosmology, to which Prof. Hommel has drawn our attention. The old Babylonian Epic of the Creation begins with the words—

“At that time the heaven above was not known by name, the earth beneath was not named, in the beginning the deep was their generator, the chaos of the sea was the mother of them all.”

The lines are the introduction to a story of the Creation of which they form an integral part. On the walls of the Pyramid of Pepi I. we read again almost the same words. Pepi, it is said, “was born of his father Tum. At that time the heaven was not, the earth was not, men did not exist, the gods were not born, there was no death.”

---

1 The Egyptian za is the Semitic zi, “ship,” from which it seems to have been borrowed.
2 Maspero, “La Pyramide du Roi Pepi 1er” in Recueil de Travaux, viii. p. 103.
without connection with the context; they cohere neither with what precedes nor with what follows them, and are evidently nothing but an old formula torn from the cosmogony to which they once belonged, and repeated without a clear understanding of what they really meant. The phrases are found again in the later religious literature of Egypt, embedded in it like flies in amber or the fossils in an old sea-beach. To recover their original meaning we must betake ourselves to the clay tablets of Assyria and Babylonia, and the cosmological theories of early Chaldæa. They presuppose that story of a creation out of the chaos of the deep which was indigenous in Babylonia alone.

This deep, which lay at the foundation of Babylonian cosmology, was symbolised in the temples by a “sea” across which the images of the gods were carried in “ships” on their days of festival. In Babylonia such “seas” had a reason for their existence. The Persian Gulf, it was believed, was the cradle of Babylonian culture; it was also the source of that cosmogony which saw in the deep the “mother” of all things. That it should have its mimic representatives in the temples of the country was but natural; it was from the “deep” that the gods had come, and the deep was still the home of the culture-god Ea.

In Egypt, on the other hand, the sea was out of place nay more, it was altogether unnatural. If water were needed, the sacred Nile flowed at the foot of the temple or else there were canals which conducted the waters of the river through the temple lands. There was no primeval deep to be symbolised, no Persian Gulf out of

1 For instance, in the Rhind Papyrus: Wiedemann, “Ein altägyptischer Weltschöpfungsmythus,” in the Urquell, new ser., ii. p. 64, “Heaven was not, earth was not, the good and evil serpents did not exist.”

2 See above, p. 80.
which the culture-god had risen with the gifts of civilisation. If the gods desired to sail in their barks, it was reasonable to suppose that they would do so on the Nile or its tributary canals. And yet the supposition would be wrong. The gods had indeed their sacred "ships" as in Babylonia; but, as in Babylonia, it was on an artificially-constructed lake that they floated, and not, as a rule, on the river Nile. Could anything indicate more clearly the origin of the religious beliefs and practices of the Pharaonic Egyptians? Like the brick tombs of the Old Empire, with their recessed panels and pilasters, it points to Babylonia and the cosmological theories which had their birth in the Babylonian plain.¹

The religion of ancient Egypt is thus no isolated fact. It links itself, on the one hand, with the beliefs and religious conceptions of the present, and, on the other hand, with those of a yet older past. But it is a linking only; Egyptian religion is no more the religion of ancient Babylonia than it is modern Christianity. In Egypt it assumed a form peculiar to itself, adapting itself to the superstitions and habits of the earlier inhabitants of the land, and developing the ideas which lay latent within it. It was characterised by the inexorable logic with which each of these ideas was followed to its minutest conclusions, and at the same time by the want of any attempt to harmonise these conclusions one with the other, however inconsistent they might be. It was also characterised by a spirit of creativeness; the Egyp-

¹ The serpent with the seven necks (Unas 630, Teta 305) is the Babylonian "serpent with the seven heads," and points to Babylonia, where alone seven was a sacred number. Other coincidences between Egyptian and Babylonian mythology that may be noted are "the tree of life" (khet n ḫnkh) which grew in Alu, and was given by the stars to the dead that they might live for ever (Pepi 431); and the "great house," the Babylonian i-gal, which is several times referred to in the Pyramid texts.
tian created new religious conceptions because he was not afraid to follow his premisses to their end.

But he was intensely practical. Abstractions as such had little attraction for him, and he translated them into material form. The symbolism of his system of writing favoured the process: even such an abstract idea as that of "becoming" became for him a "transformation" or "change of outward shape." In spite, therefore, of the spirituality and profundity of much of his theology, his religion remained essentially materialistic. The gods might indeed pass one into the other and be but the manifold forms under which the ever-changing divine essence manifested itself, but this was because it was one with nature and the infinite variety which nature displays. Even the supreme god of Khu-n-Aten incorporated himself at it were in the visible orb of the sun.

The incarnation of the deity accordingly presented no difficulty to the Egyptian mind. It followed necessarily from the fundamental principles of his creed. The divinity which permeated the whole of nature revealed itself more clearly than elsewhere in that which possessed life. Egyptian religious thought never quite shook itself free from the influences of the primitive belief that life and motion were the same. Whatever moves possesses life, whatever lives must move; such was, and still is, one of the axioms of primitive man. And since the deity manifested itself in movement, it could be recognised in whatever was alive. Man on the one side became a god in the person of the Pharaoh, the gods on the other side became men who had lived and died like Osiris, or had ruled over Egypt in the days of old. Even the ordinary man contained within him a particle or effluence of the divine essence which could never die; and the bodily husk in which it was incarnated could, under certain conditions, acquire the properties of that divinity to
which it had afforded a home. That the divine essence could thus assume an individual form, was part of the doctrine which saw, in the manifold varieties of nature, the manifestations of a "single god." The belief in the incarnation of the deity was a necessary consequence of a materialistic pantheism. And it mattered little whether the incarnation took place under a human or under an animal shape; the human and the animal god had alike been a heritage from elements which, diverse though they may have been in origin, combined to form the Egyptian people, and both the man and the beast were alike living and therefore divine. The beast was more mysterious than the man, that was all; the workings of its mind were more difficult to comprehend, and the language it spoke was more unintelligible. But on that very account it was better adapted for the symbolism which literature and education encouraged, and which became an essential part of the texture of Egyptian thought.

If, then, we would understand the conception of the divine formed by the educated Egyptian of the historical age, we must remember the characteristics of Egyptian thought which lay behind it. Materialism and symbolism constituted the background of Egyptian religion. The one presupposed the other, for the symbol presented the abstract idea in a material and visible shape, while the materialism of the Egyptian mind demanded something concrete which the senses could apprehend. The conception of the ka, with which Egyptian religion begins, is characteristic of Egyptian religious thought up to the last. It is like the "materialised spirits" of modern spiritualism, spirits which are merely matter in an etherialised form. The Egyptian gave not only shape but substance to his mental and spiritual creations; like the "ideas" of Plato, they became sensuous realities like the written symbols which expressed them. Not only were
the name and the thing never dissociated from one another, the name was looked on as the essence of the thing, and the name included its expression in both sound and writing. The bird which represented the idea of "soul" became in time the soul itself.

This very fact assisted in spiritualising Egyptian religion. Ideas and their symbols interchange one with the other; the ideas, moreover, develop and pass out of one form into another. The identification, therefore, of the abstract and the concrete, of ideas and substantial existence, made a pantheistic conception of the universe easy. The divinity clothed itself in as many forms as there were symbols to express it, and these forms passed one into the other like phases of thought. The Egyptian was the first discoverer of the term "becoming," and the keynote of his creed was the doctrine of transformation.

Transformation, it must be remembered, is not transmigration. There was no passage of an individual soul from body to body, from form to form; the divine essence permeated all bodies and forms alike, though it manifested itself at a given moment only under certain ones. It was in this power of manifestation that the transformation consisted. Had the Egyptian not been fettered by his materialistic symbolism, he would doubtless have gone further and concluded that the various manifestations of the divinity were subjective only—existing, that is to say, only in the mind of the observer; as it was, he held them to be objective, and to possess the same substantial reality as the symbolic pictures by which they were denoted.

With all this, however, there was no severe literalism in the interpretation of the symbol. Whatever may have been the case at the outset, the symbol was as much a metaphor in the historical ages of Egyptian history as are the metaphors of our own language. When the Egyptian
spoke of "eating" his god, he meant no more than we do when we speak of "absorbing" a subject. The Pyramid texts are full of such faded and forgotten metaphors; the Egyptian was conservative above all other men, and the language of religion is conservative above all others. Doubtless, in some cases, he was the victim of the symbols and metaphors he used; but in this respect he does not stand alone. Where he has no rival is in the magnitude of the part played in his religion by the symbol and its logical development.

It was just this symbolism which enabled him to retain, on the one hand, all the old formulæ with their gross materialism and childlike views of the universe, and, on the other hand, to attain to a conception of the divine being which was at once spiritual and sublime. For Egyptian religion, as we find it in the monuments of the educated classes before the decay of the monarchy, was, in spite of its outward show of symbols and amulets, full of high thoughts and deep emotions. I cannot do better than quote the words in which it is described by one of its least prejudiced students, Professor Maspero: "When we put aside the popular superstitions and endeavour solely to ascertain its fundamental doctrines, we soon recognise that few religions have been so exalted in their principles. The Egyptians adored a being who was unique, perfect, endowed with absolute knowledge and intelligence, and incomprehensible to such an extent that it passes man's powers to state in what he is incomprehensible. He is 'the one of one, he who exists essentially, the only one who lives substantially, the sole generator in heaven and earth, who is not himself generated.' Always the same, always immutable in his immutable perfection, always

1 Thus in the Pyramid texts (Unas 518) Unas is described as "eating" the crowns of Upper and Lower Egypt.

2 Études de Mythologie et d'Archéologie égyptiennes, ii. pp. 446, 447.
present in the past as in the future, he fills the universe without any form in the world being able to give even a feeble idea of his immensity; he is felt everywhere, he is perceived nowhere.

"Unique in essence, he is not unique in person. He is father because he exists, and the force of his nature is such that he is eternally begetting, without ever growing weak or exhausted. He has no need to go outside himself for this act of generation; he finds in his own bosom the material of his perpetual fatherhood. Alone in the plenitude of his being he conceives his offspring; and as in him there can be no distinction between conception and birth, from all eternity 'he produces in himself another self.' He is at once the divine father, mother, and son. Conceived of God, born of God, without separating from God, these three persons are God in God, and, far from dividing the primitive unity of the divine nature, they all three combine to constitute his infinite perfection.

"Doubtless the mind of the uneducated classes could neither understand nor rise to such lofty heights. Human intelligence supports with difficulty so pure an idea of an absolute being. All the attributes of divinity—his immensity, his eternity, his independence—place him at an infinite distance from ourselves; to comprehend and participate in them, we must make him think as we think, we must lend him our passions and subject him to our laws. God must take upon him, with human nature, all the weaknesses that accompany it, all the infirmities under which it labours; in a word, the Word must become flesh. The immaterial god must incarnate himself, must come to the land of Egypt and people it with the gods, his children. Each of the persons of the primitive trinity thus became independent and formed a new type, from which, in their turn, other
lower types emanated. From trinity to trinity, from personification to personification, that truly incredible number of divinities was soon reached, with forms sometimes grotesque and often monstrous, who descended by almost insensible degrees from the highest to the lowest ranks of nature. The scribes, the priests, the officials, all the educated world, in fact, of Egyptian society, never professed that gross paganism which caused Egypt to be called with justice 'the mother of superstitions.' The various names and innumerable forms attributed by the multitude to as many distinct and independent divinities, were for them merely names and forms of one and the same being. 'God, when he comes as a generator, and brings to light the latent forces of the hidden causes, is called Ammon; when he is the spirit who embodies all that is intelligent, he is Imhotep; when he is he who accomplishes all things with art and verity, he is Pthah; when he is God good and beneficent, he is Osiris.' What the scribe means by these words is the mysterious infinite which animates the universe, the eternal, impenetrable to eyes of flesh, but perceived vaguely by the eyes of the spirit. Behind the sensuous appearance, behind the manifestation of the divine nature wherein the popular imagination fancied it saw that nature itself, he beheld confusedly a being obscure and sublime, a full comprehension of whom is denied him, and the feeling of this incomprehensible presence lends to his prayer a deep and thrilling accent, a sincerity of thought and emotion, a thousand times more touching than that medley of amorous puerilities, of mystic languors and morbid contrition, which is so often the substitute for religious poetry."

There were two deep-rooted conceptions in the Egyptian mind which had much to do with the purity and sublimity of his religious ideas. One of these was
the conception of a divine law which governed the universe, and to which the gods themselves had to submit. The other was that of a moral God, of a "good being" who rewarded—not piety but—uprightness, and punished iniquity. The world was ordered and controlled, not by chance or caprice, but by a fixed law, which was, characteristically enough, impersonated in the goddess Mât. And this law, unlike the blind destiny of the Greek or Roman, was at once divine and moral; it not only represented the order of the universe, against which there was no appeal, but it also represented an order which was in accordance with justice and truth. The law which all must obey under penalty of being cast into outer darkness, was an intelligent and moral law; it commended itself necessarily and instinctively to all intelligent beings whose thoughts, words, and deeds were alike righteous. Only those who had conformed to it could be admitted after death into the paradise of Osiris or into the company of the gods, and the seal of justification was the pronouncement that the dead man had "spoken the truth," and that his confession in the judgment-hall of Osiris had been in agreement with the truth and with the eternal order of the universe.

Of the moral character of the Osirian creed I have already spoken. It is the first official recognition by religion that what God requires is uprightness of conduct and not ceremonial orthodoxy, the first identification of religion with morality. And the god who required this uprightness of conduct was not a "lord of hosts," who compelled adoration by the display of his power, but Un-nefer, "the good being," who existed in order to do good to men. In the conflict with evil he had apparently been worsted; but though he had died a shameful death, his disciples believed that it had been endured on their behalf, and that for those who followed
in his footsteps, and whose lives resembled his, he had provided a better and a happier Egypt in another world, into which sin and pain and death could not enter, and where he ruled eternally over the cities and fields of the blest.

In the Osirian creed, writer after writer has discovered "fore-gleams" of Christianity more striking even than the doctrine of the Trinity, which belongs to the philosophy of faith. But there is nothing wonderful in the continuity of religious thought. One of the chief lessons impressed upon us by the science of the century which has just passed away, is that of continuity; throughout the world of nature there is no break, no isolated link in the long chain of antecedent and consequent, and still less is there any in the world of thought. Development is but another name for the continuity which binds the past to the present with stronger fetters than those of destiny. It is not only the philosophy of Christianity, or the wider and more general doctrines of its creed, which find an echo in the religion of ancient Egypt; in details also Egypt is linked with the modern world. Long before the Hebrew prophets pictured the kingdom of the Messiah, an Egyptian poet, in the reign of Thothmes III., had said: "A king shall come from the south, Amen, the truth-declaring, by name. He shall be the son of a woman of Nubia, and will be born in [the south]. ... He shall assume the crown of Upper Egypt, and lift up the red crown of the north. He shall unite the double crown. ... The people of the age of the son of man shall rejoice and establish his name for all eternity. They shall be removed far from evil, and the wicked shall humble their mouths for fear of him. The Asians shall fall before his blows, and the Libyans before his flame. The wicked shall wait on his judgments, the
rebels on his power. The royal serpent on his brow shall pacify the revolted. A wall shall be built, even that of the prince, that the Asiatics may no more enter into Egypt.”

Yet more striking is the belief in the virgin-birth of the god Pharaoh, which goes back at least to the time of the Eighteenth Dynasty. On the western wall of one of the chambers in the southern portion of the temple of Luxor, Champollion first noticed that the birth of Amon-hotep III. is portrayed. The inscriptions and scenes which describe it have since been copied, and we learn from them that he had no human father; Amon himself descended from heaven and became the father of the future king. His mother was still a virgin when the god of Thebes "incarnated himself," so that she might "behold him in his divine form." And then the hieroglyphic record continues with words that are put into the mouth of the god. "Amon-hotep," he is made to say, "is the name of the son who is in thy womb. He shall grow up according to the words that proceed out of thy mouth. He shall exercise sovereignty and righteousness in this land unto its very end. My soul is in him, (and) he shall wear the twofold crown of royalty, ruling the two worlds like the sun for ever.”

1 Golénischeff, in the Recueil de Travaux, xv. pp. 88, 89. The passage is found in Papyrus 1116 of the Hermitage at St. Petersburg. The words "son of man" are a literal translation of the original si-n-sa.

2 For the scenes accompanying the text, see Gayet, "Le Temple de Louxor," in the Mémoires de la Mission archéologique française au Caire, xv. 1, pl. lxxi., where, however, the copy of the inscriptions is very incorrect. My translation is made from a copy of my own. The whole inscription is as follows: "Said by Amon-Ra, etc.: He (the god) has incarnated himself in the royal person of this husband, Thothmes IV., etc.; he found her lying in her beauty; he stood beside her as a god. She has fed upon sweet odours emanating from his majesty. He has gone to her that he may be a father through her. He caused her to behold him in his divine form when he had gone upon her that she might bear a child
But Amon-hotep III. was not the first of whom it had been said that his father was a god. Fragments of a similar text have been found by Dr. Naville at Dér el-Bâhâri, from which we may gather that queen Hatshepsu also claimed to have been born of Amon. How much further back in Egyptian history the belief may go we do not know: the kings of the Fifth and Sixth Dynasties called themselves sons of the sun-god, and the Theban monarchs whose virgin-mothers were wedded to Amon, incarnate in the flesh, did but work out the old conception in a more detailed and definite way.

It was given to the Egyptians to be one among the few inventive races of mankind. They were pioneers of civilisation; above all, they were the inventors of religious ideas. The ideas, it is true, were not self-evolved; they presupposed beliefs which had been bequeathed by the past; but their logical development and the forms which they assumed were the work of the Egyptian people. We owe to them the chief moulds into which religious thought has since been thrown. The doctrines of emanation, of a trinity wherein one god manifests himself in three persons, of absolute thought as the underlying and permanent substance of all things, all go back to the priestly philosophers of Egypt. Gnosticism and Alexandrianism, the speculations of at the sight of his beauty. His loveliness penetrated her flesh, filling it with the odour of all his perfumes of Punt.

"Said by Mut-em-ua before the majesty of this august god Amon, etc., the twofold divinity: How great is thy twofold will, how [glorious thy] designs in making thy heart repose upon me! Thy dew is upon all my flesh in . . . This royal god has done all that is pleasing to him with her.

"Said by Amon before her majesty: Amon-hotep is the name of the son which is in thy womb. This child shall grow up according to the words which proceed out of thy mouth. He shall exercise sovereignty and righteousness in this land unto its very end. My soul is in him: he shall wear the twofold crown of royalty, ruling the two lands like the sun for ever."
Christian metaphysic and the philosophy of Hegel, have their roots in the valley of the Nile. The Egyptian thinkers themselves, indeed, never enjoyed the full fruition of the ideas they had created; their eyes were blinded by the symbolism which had guided their first efforts, their sight was dulled by overmuch reverence for the past, and the materialism which came of a contentment with this life. They ended in the scepticism of despair or the prosaic superstitions of a decadent age. But the task which dropped from their hands was taken up by others; the seeds which they had sown were not allowed to wither, and, like the elements of our culture and civilisation, the elements also of our modes of religious thought may be traced back to the “dwellers on the Nile.” We are heirs of the civilised past, and a goodly portion of that civilised past was the creation of ancient Egypt.
